Glossary ... 45

Quick Start

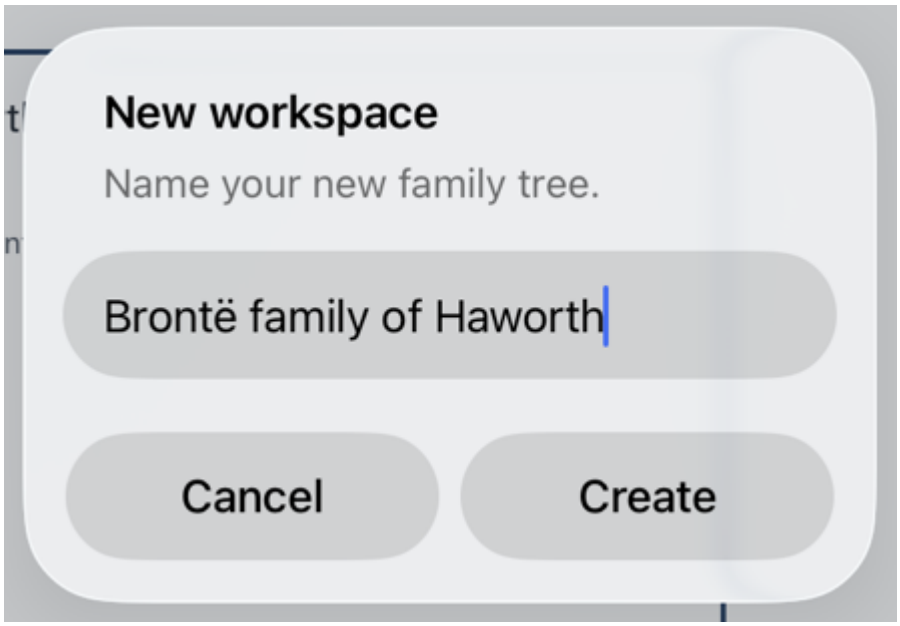

Six short pages that take you from opening uFTi to your first person, with its source and a copy.

This takes about ten minutes. Each page has a few steps. Do them in order.

Add your first person

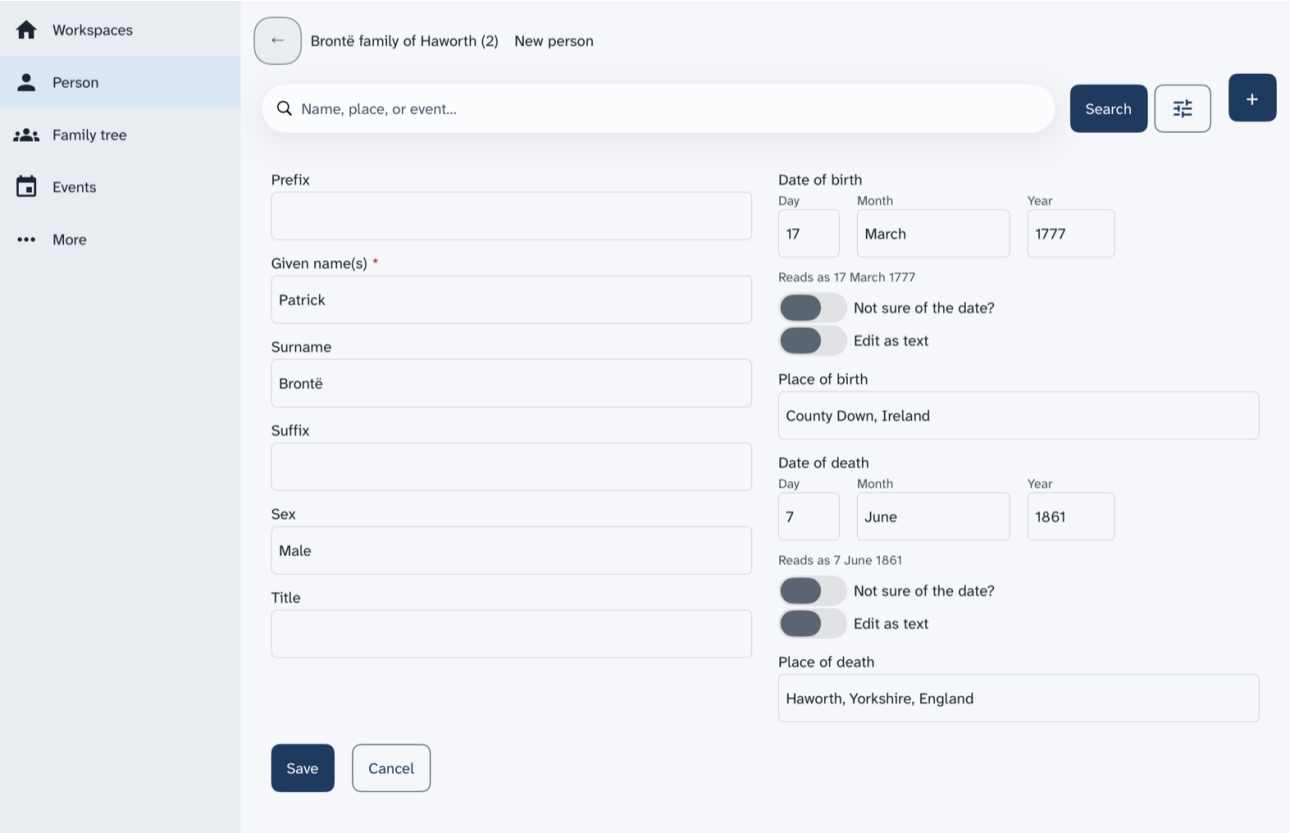

Make your own workspace and add yourself, or someone you know well.

1. On **Workspaces**, choose **Create workspace**.
   A small box named New workspace opens. It starts with a name already in the box.

2. Type a name for your tree, such as `My family`, in place of the name that is there.
3. Choose **Create**.
   The **New person** form opens.
4. Type a first name in **Given name(s)**. Type a last name in **Surname**.
   Start with yourself, or someone you know well. Only the first name is needed. If you know the birth date, type it too.
5. Choose **Save** at the end of the form. Scroll down if you need to.
   The page for that person opens. A short Saved message may show at the bottom.

That is your first person. uFTi saves your work as you go.

Next: Look around (page 4).

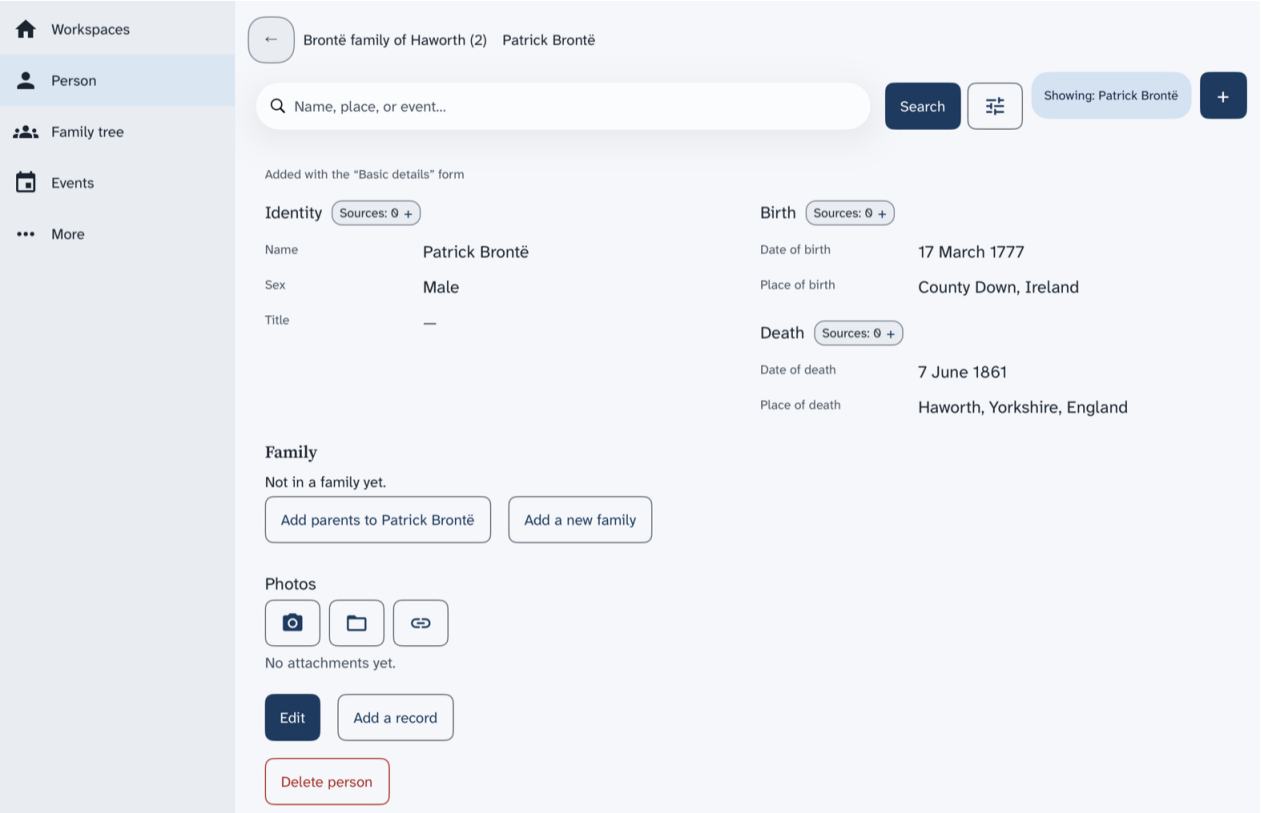

Look around

See what the places in the list on the left and the search box do for the person you added.

Add a person first.

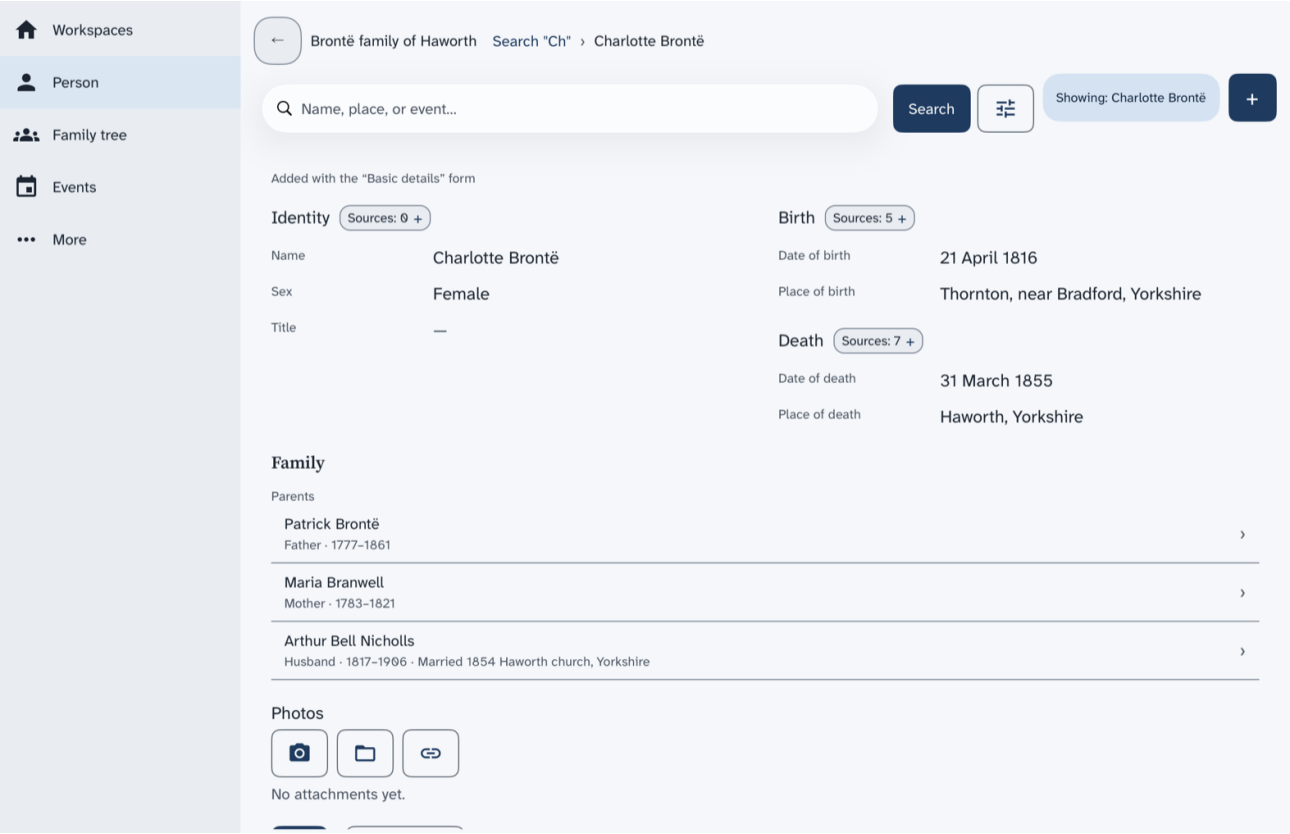

The list down the left side of the screen shows the main places. Most of them show the person you are looking at.

1. Choose **Person**.
   It shows that person's page.

2. Choose **Events**.
   It lists what happened in that person's life, such as a birth. Each one is a fact.
3. Choose **Family tree**.
   It draws a tree of that person, with parents above and children below.
4. Choose **More**.
   It lists **Notes** and some other places. They are for later.
5. Type a few letters of a name in the search box, then choose **Search**.
   The results are the only list of people. Choose a card to open that person.

To go back one screen, choose the back arrow at the top left.

Next: Say where you found it (page 6).

Say where you found it

Add a source to a fact, so you always know why you believe it.

Open the page of a person who has a birth date.

To find a person, type their name in the search box and choose **Search**. Then choose the card with their name.

1. Choose the small chip beside **Birth**.
   It shows a number and a plus sign, such as `0 +`.

   A screen named **Sources** opens.
2. Choose **Add source**, then **Add a new source**.
3. In **Title**, type where you know this from.
   For example, `My birth certificate` or `Mum told me`. Only this box is needed.
4. Choose **Save source**.
5. Choose **Done**, then **Done** again.
   The number on the chip goes up by one.

The fact now has a source. Later, when two records disagree, this is how you will know what to believe.

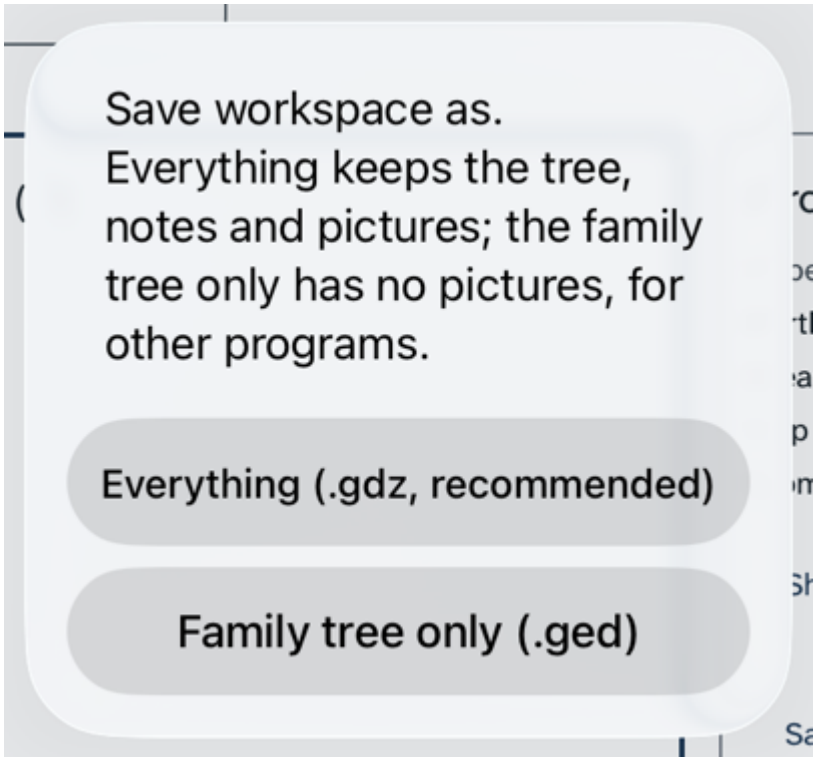

Next: Keep it safe (page 7).

Keep it safe

Save a copy of your tree as a file, and keep it somewhere else too.

1. Open **Workspaces**.
2. On the card for your tree, choose **Save as...**.

   A small box opens. It starts with the words Save workspace as and asks how to save your tree.

3. Choose how to save your tree.

   - **Everything (.gdz, recommended)** saves everything in one file, with its pictures. Choose this one.
   - **Family tree only (.ged)** saves your tree as a family tree file, without pictures. Use it only for a program that cannot read GEDZIP. If asked which version, choose GEDCOM 7 unless that program is old.

   A second box asks Which version of GEDCOM?.

4. In the Files screen, choose where to put the file, then choose **Save**.

You now have a copy. Make a new one after you add a lot. Keep one off your device too.

> If you opened a file from another program, uFTi keeps its own copy. The file you chose does not change.

Next: What next (page 8).

What next

You have a tree, a person, a fact with its source and a copy, so choose where to go from here.

Well done. What do you want to do now?

- Record more of what you have found. Say where you found it (page 6) shows how.
- Learn the ideas behind it all. Read Five things to know (page 9). It takes two minutes.

Five things to know

The five ideas behind uFTi, in two minutes.

A workspace is one family tree

You can have more than one. Each shows as a card on the **Workspaces** screen. Make a new workspace for each tree.

People and families

Add a person for each relative. A family joins a couple. uFTi draws a tree from your families. Choose **Family** to see it.

Facts and sources

A fact is something you record, such as a birth with its date. A source is where you found it. It can be a certificate, a census page, or what someone told you. A small chip beside each heading on a person's page counts the sources. Choose the chip to add one. Then you will always know why you believe a fact.

Saving and copies

uFTi saves your work as you go. To keep a copy, choose **Save as...** on your workspace's card. Keep the file somewhere else too. Do it again after a big session.

Getting help

Look in this guide when you are stuck. Use its search box, and type the words you would say. Practise in a workspace you make for the purpose.

Work with your tree

Find people, add people and families, read their events and sources, and write notes.

This chapter is for everything you do once a tree is open. It starts with a picture of every screen. Then it shows how to find a person, how to read what the app knows about them, and how to add more. Each page has a few steps and a picture of the result.

The pictures use one small tree: the family of Patrick Brontë of Haworth, a village in Yorkshire. You can build it yourself, a little at a time, as you read.

The screens of the app

What each place in the list on the left shows, with a picture of each screen.

The list on the left

A list of five places runs down the left side of every screen, whichever way up you hold the iPad. The place you are in is shaded. The first four are the main places. Some show your whole tree. Others show one person, the person named in the chip that starts with **Showing**. The chip shows once you open someone.

Table 1. The main places and what they show

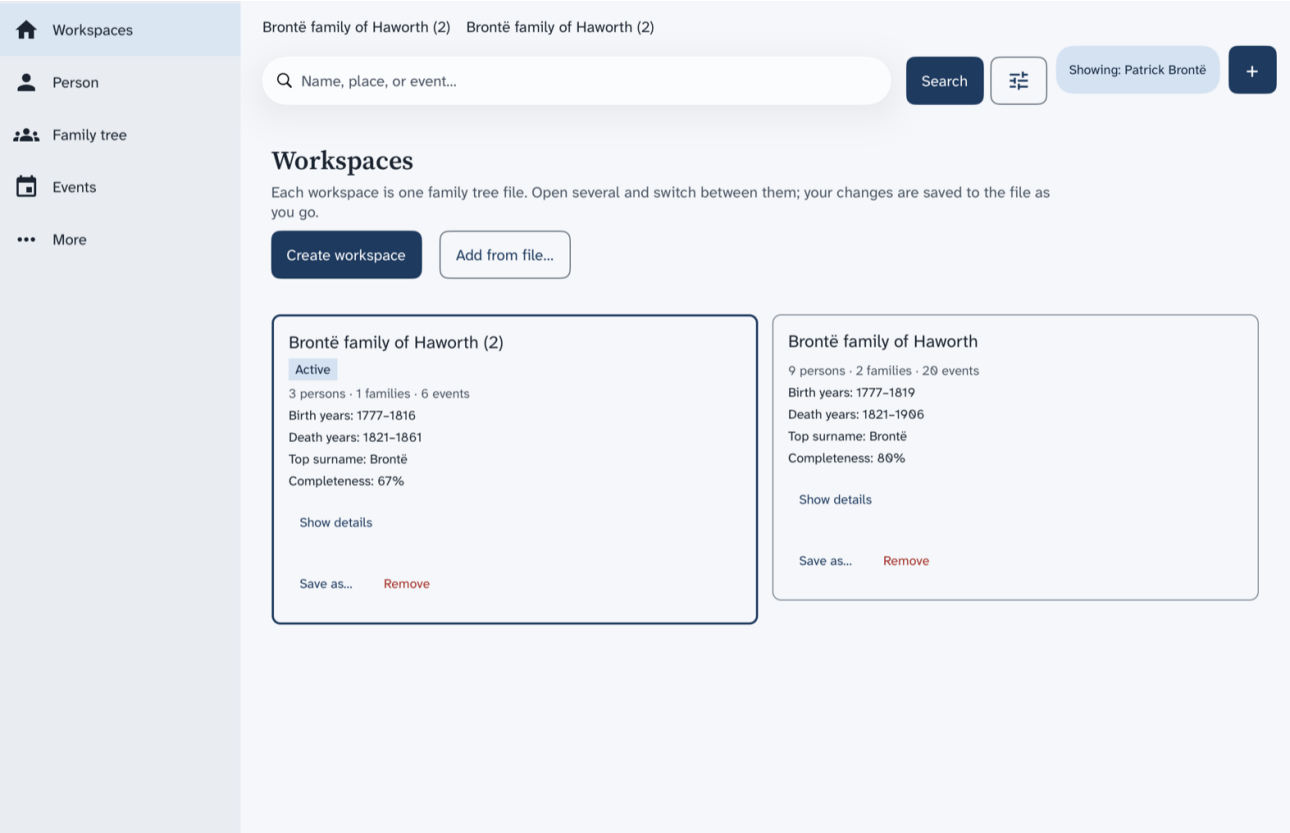

Place	What it shows	Needs a person
Workspaces	Your family trees, one card for each.	No
Person	The page of one person.	Yes
Family tree	A drawing of the person with parents, partners and children.	Yes
Events	The things that happened in that person's life.	Yes

The search box and the **+** button are along the top of every screen. Above them, a line names the tree and the page you are on. Choose a name in that line to go back to that page. A back arrow at the top left takes you back one screen.

> If a page says Select a person or shows only the search box, it needs a person first. Search for someone, then open them. A page says no person is selected (page 38) shows how.

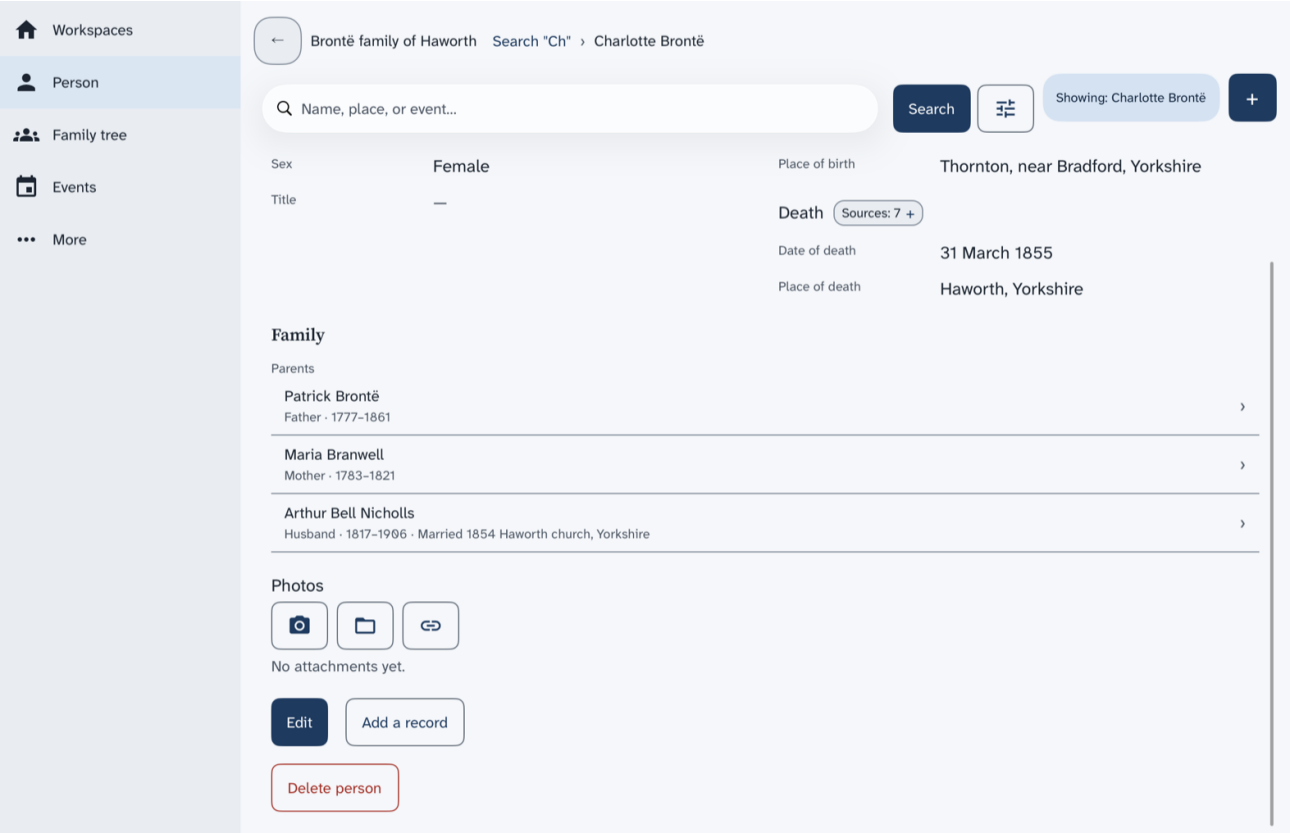

Workspaces

This is the first screen. Each card is one family tree. It tells you how many people, families and events the tree holds. Remove a tree from the list (page 43) starts here.

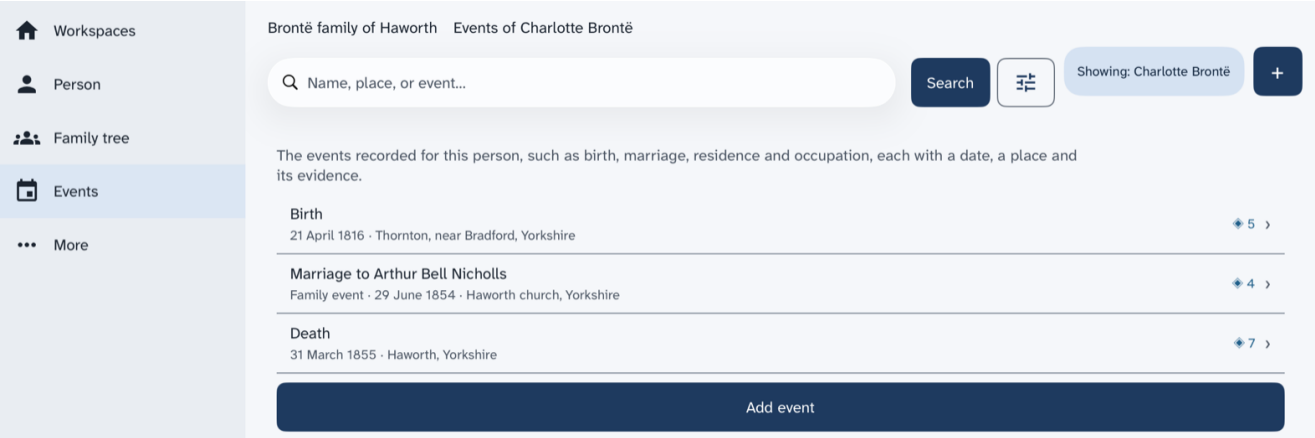

Person

This is one person's page: their names, their birth and death, their family and their photos. Find a person (page 14) shows how to open it.

Family tree and Events

See a family tree (page 15) explains the tree. See the events of a person (page 17) explains the list of events.

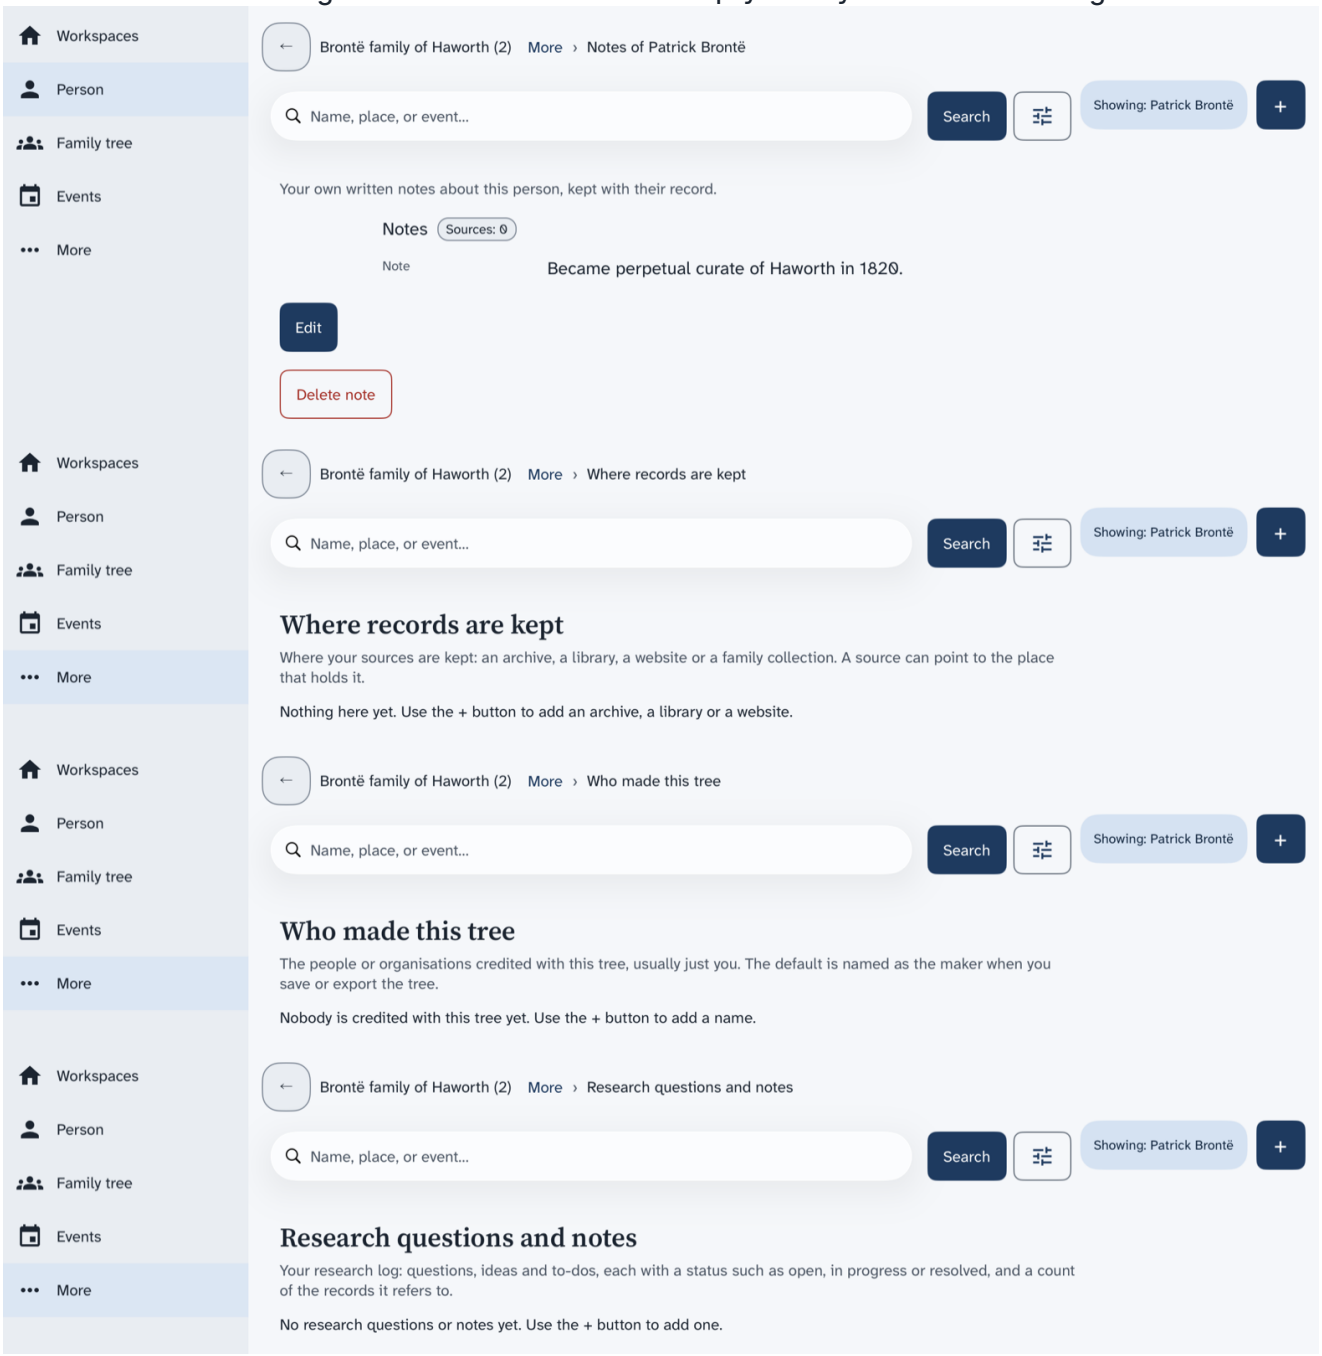

More

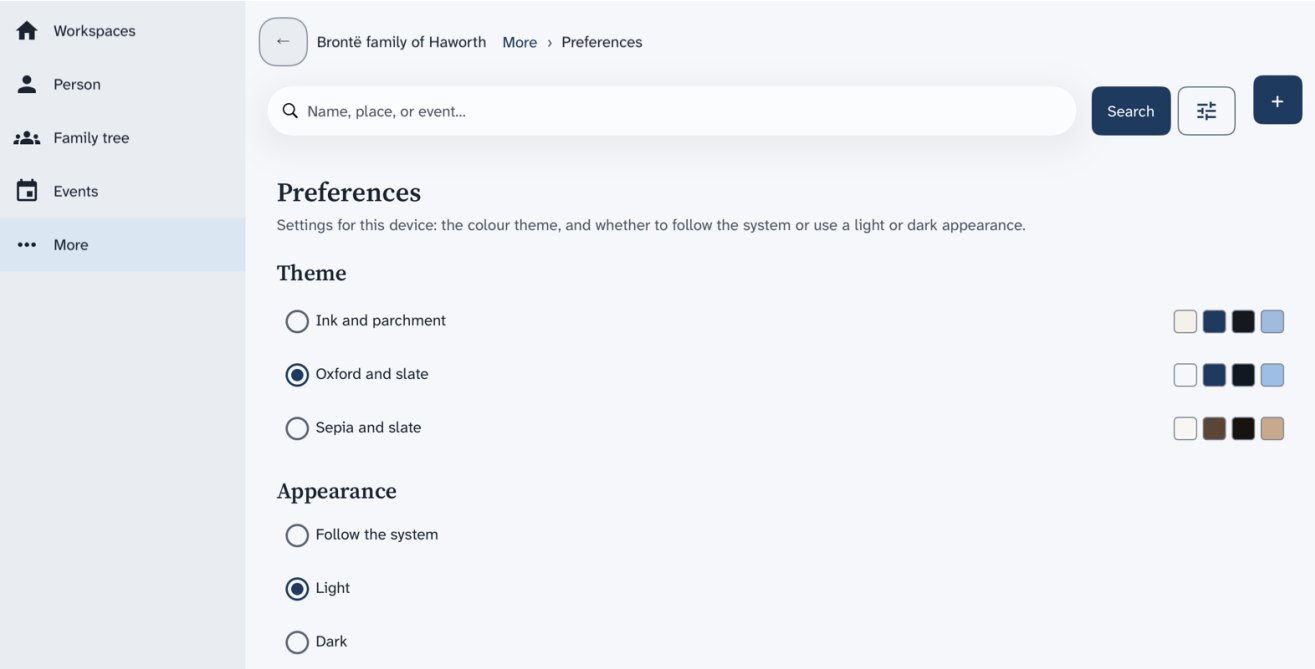

The fifth place in the list, **More**, opens a list of six more places. Each one opens a screen of its own.

- **Notes** shows your own notes about the person you are looking at. Add a note to a person (page 36) shows how to write one.
- **Where records are kept** lists the archives, libraries and websites that your sources come from.

- **Who made this tree** lists the people credited with the tree.
- **Research questions and notes** is your list of questions and ideas.
- **Preferences** sets the colours and the light or dark look. Choose how the app looks (page 37) explains it.
- **About uFTi** shows the version of the app.

The three that list things for the whole tree are empty until you add something with **+**.

When the iPad is upright

The pictures in this manual show the iPad on its side. Upright, the screen is narrower, and some screens change.

- The list on the left stays.
- A person's page and the forms are in one column. **Save** is further down, so scroll to find it.
- Search results are in one column, people above events. Buttons above them show everything, only the people or only the events.
- The cards on **Workspaces** are one under another.

Find a person

Search your tree by a name, a place or an event, then open the person you want.

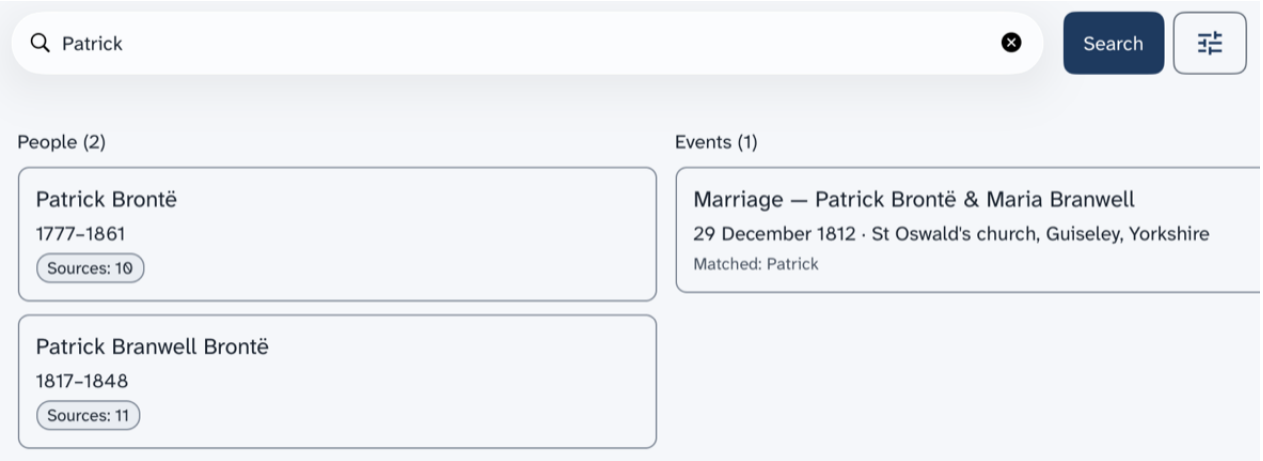

The search box is at the top of every screen. It searches the tree that is open. There is no list of all your people: search is how you find one.

1. Type a name, a place or an event in the box at the top.

   For example, type `Patrick`.

2. Choose **Search**.

   The results come in two columns. The people are on the left. The events are on the right. A small badge on each person, such as Sources: 10, says how many sources back that person up. When the iPad is upright, the results are in one column, with buttons above them to show everything, only the people or only the events.

3. Choose the card of the person you want.
   The page of that person opens. Their name shows in the chip that starts with **Showing**.

Now **Family tree**, **Events** and **Notes** all show that person.

To narrow the results, choose the button with the sliders next to **Search**. A list named **Refine by** opens. Tick **Dates**, **Sex**, **Place** or **Event type** to add a filter. Tick **Approximate (sound-alike) matches** to also find names that sound alike. Choose **Clear filters** to start again.

Next: See a family tree (page 15).

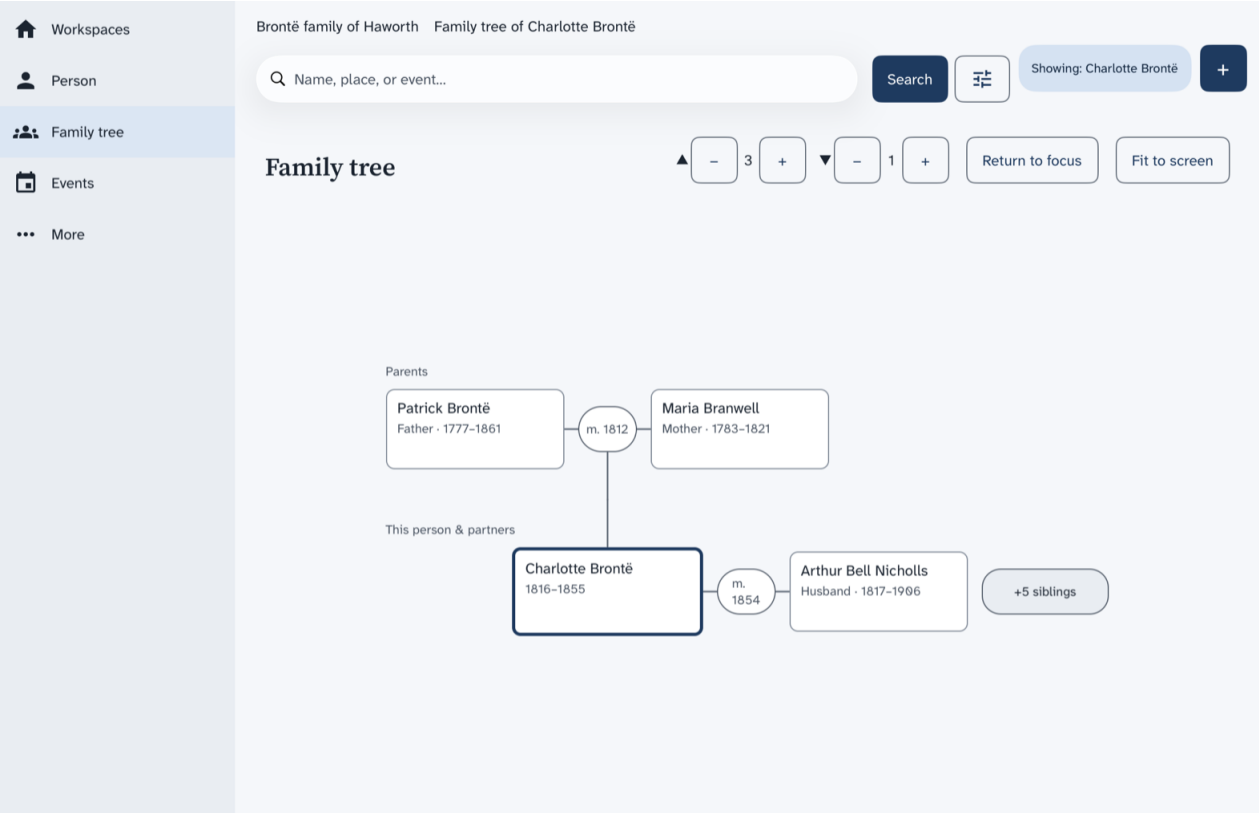

See a family tree

Draw the parents, partners and children of one person.

Open a person first. Find a person (page 14) shows how.

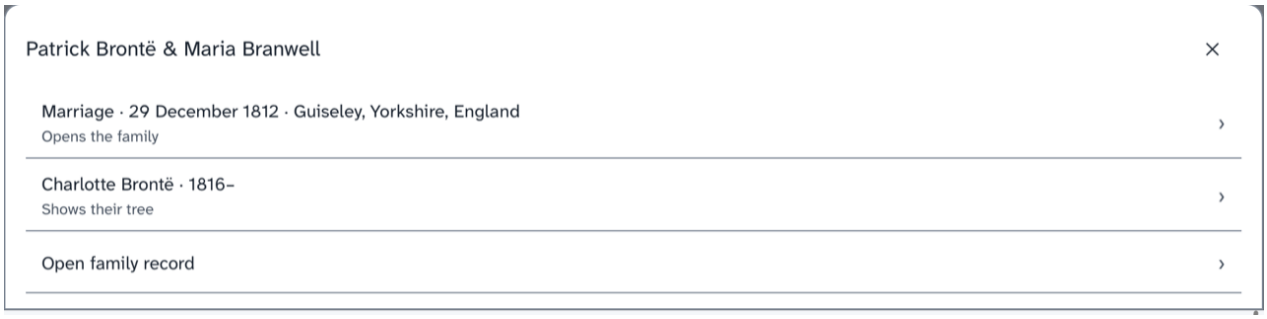

1. Choose **Family tree** in the list on the left.

A drawing opens, with the person you chose in a box with a dark edge. Their parents are above. Their partners are beside them. Their children are below.

2. Choose the round mark between two partners.

   The mark shows the year of their marriage. A sheet opens from the bottom. It names the couple and lists their marriage and each child.

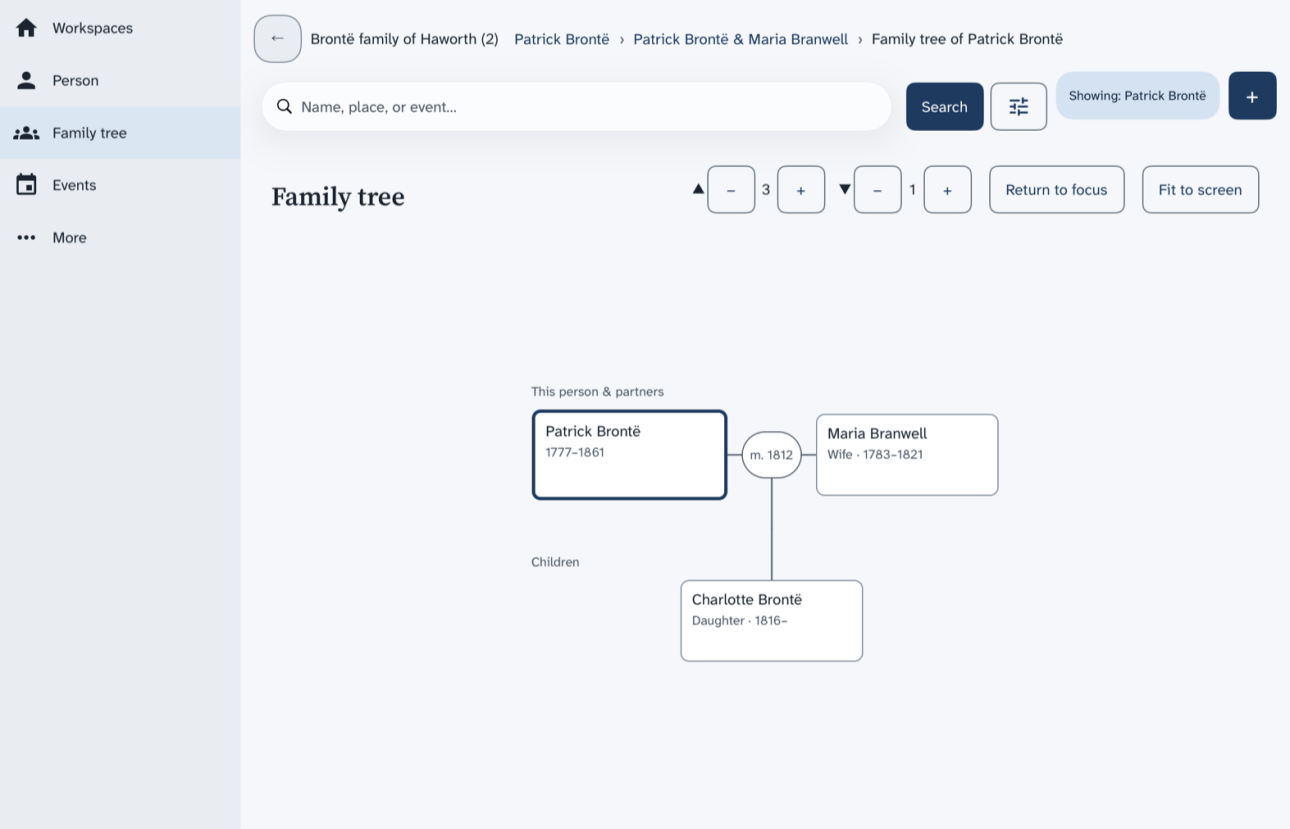

3. Choose a line in the sheet.

   The marriage line opens the page of that family. A child's line shows the tree of that child. Open family record is another way to open the family page. To close the sheet without choosing, choose the cross at its top right.

4. Use the minus and plus buttons at the top to show fewer or more generations.

The pair beside the up arrow is for parents and older people. The pair beside the down arrow is for children and younger people.

Choose **Return to focus** to go back to the first person. Choose **Fit to screen** to see the whole drawing at once when it is big. A button such as +5 siblings means more brothers and sisters are not drawn.

Choose a person's box to draw the tree again around that person. They become the person the chip that starts with **Showing** names.

The tree and a person's page are two screens. The tree never shows the page beside it, even with the iPad on its side. To read the page of the person in the middle of the tree, choose **Person** in the list on the left. To go back to the tree, choose **Family tree**.

The same tree is the pedigree in older manuals. Next: See the events of a person (page 17).

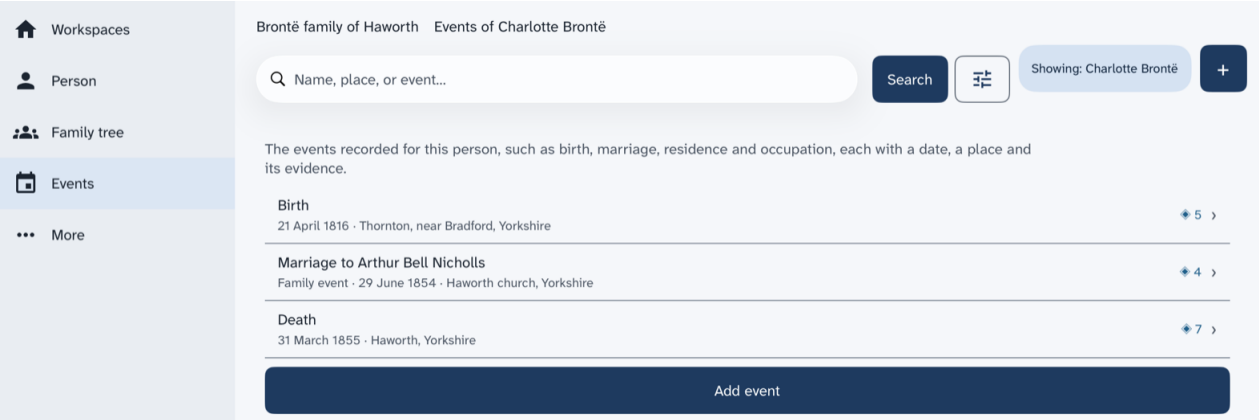

See the events of a person

List what happened in a person's life, such as birth, marriage and death, and open any one.

Open a person first. Find a person (page 14) shows how.

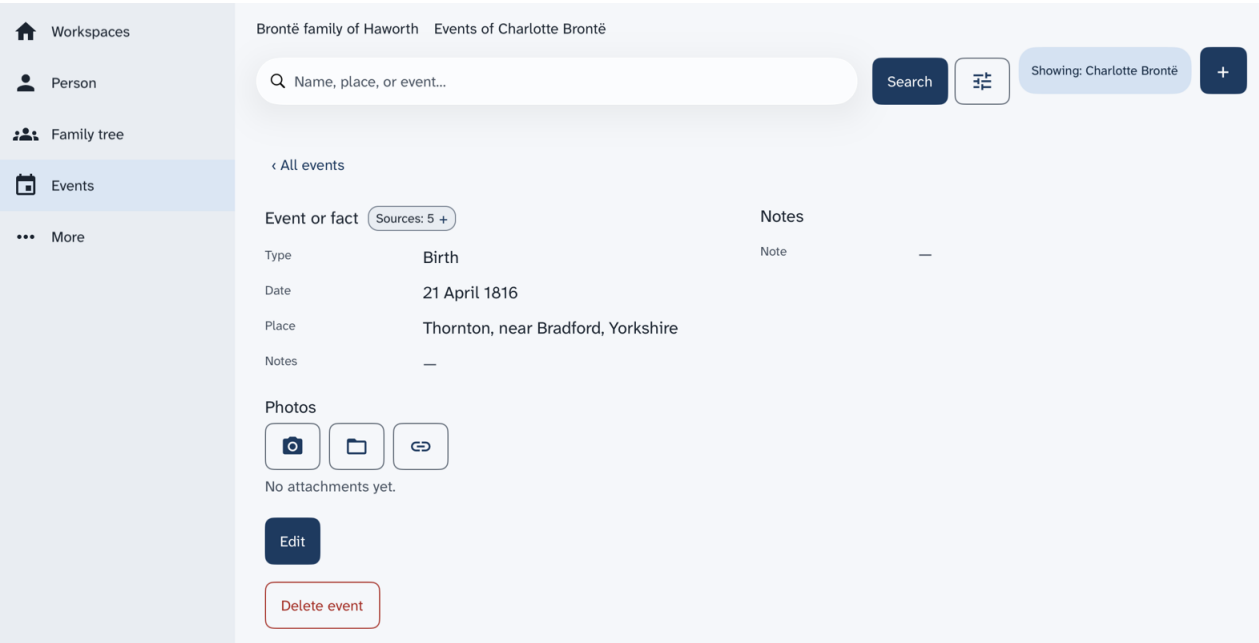

1. Choose **Events** in the list on the left.

Each event has a line with its name, its date and its place. A small number at the right counts the sources for it, once it has one.

2. Choose an event to open it.

   A page shows its type, date and place. It has a count of sources, a row of photo buttons, and the buttons **Edit** and **Delete event**.

3. Choose **All events** at the top to go back to the list.

To add an event, choose **Add event** under the list.

Next: Look at the sources of a fact (page 28).

Dates

How uFTi records a date, from one you know in full to one you only know in part.

Most dates are simple. Type the day, the month and the year, such as `15 March 1900`. You can write the month in words or choose it from the list.

A line under the date starts with Reads as. It shows how uFTi has understood the date. Look at it each time. If it is not what you meant, change the date.

When you know less

The date editor asks **How much do you know?**. Choose **The year**, **The month and year** or **The whole date**, to match what the record gives you.

Do not make up a day or a month to fill the gap. A newspaper may say that a book came out in December 1847. Then choose the month and the year, and stop there.

When you are not sure

Choose **Not sure of the date?** to say how sure you are. You can say that a date is about right, worked out by you, or a limit. You can also give a span of time. The kinds of date (page 19) lists each choice, with an example.

Typing the date

Choose **Edit as text** to type the whole date in one box, such as `about 1900` or `between 1850 and 1860`. Some things you might type are kept as typed and not read as a date. Typing a date (page 21) says which.

Old dates

A date from long ago may need more care. Britain changed its calendar in 1752. Before that, the year there began in March. uFTi can keep a date in the calendar of the record.

For example, the diarist Abraham De la Pryme gives his birthday as 15 January 1671. England used the Julian calendar then. To keep the date in that calendar, type `Julian 15 January 1671`. The Reads as line then shows 15 January 1671 (Julian).

Calendars and old dates (page 22) explains how this works. A worked case: a birth in January (page 23) and A worked case: two calendars in one life (page 24) follow his dates through real cases.

Where dates are used

uFTi uses dates to order the events of a person. Dates in lists and in order (page 25) shows where you can enter a date, how dates are shown and how uncertain dates are ordered.

The kinds of date

Seven ways to say how sure you are of a date, each with an example.

Say what the record says

A date in a family tree is often not exact. The kind of date lets the tree say so. Choose **Not sure of the date?** to see the kinds under **Kind of date**. Pick the one that matches your evidence, not the one that sounds neatest.

Table 1. The seven kinds of date

Kind	Use it when	Example	Type it as
On	You know the date.	A copy of a parish register says that Emily Brontë was buried on 22 December 1848.	`22 December 1848`
About	A record or a story gives a date that is close, but not exact.	A family story says that a great-uncle left home about 1850.	`about 1850`
Estimated	You worked the date out yourself, for example from an age.	A census says that a woman was 30 in 1851. You work out that she was born about 1821.	`estimated 1821`
Before	It happened on or before this date.	Branwell Brontë had drawing lessons before 1835.	`before 1835`
After	It happened on or after this date.	Branwell worked as a portrait painter after his visit to London in 1835.	`after 1835`
Between two dates	You know the earliest and the latest date it could have been.	A memorial tablet says that Maria Brontë died on 6 May 1825, in the 12th year of her age. So she was born between 7 May 1813 and 6 May 1814.	`between 7 May 1813 and 6 May 1814`
From a date to a date	Something went on for a while, such as a job or a stay.	Patrick Brontë was curate of Thornton from 1815 to 1820.	`from 1815 to 1820`

A limit is not a guess

Use **Before** and **After** for a limit that a record gives you. A baptism can be a limit on a birth, because a child is baptised after being born. Use **Estimated** only for a date that you worked out.

When two sources disagree

Do not pick one date and drop the other. Record each date with the source that gives it. Then your tree shows the disagreement, and a later record may settle it.

Typing a date

What uFTi reads when you type a date in one box, and what it keeps exactly as you typed it.

Plain words

Choose **Edit as text** to type a whole date. Write it in words, with the day first, then the month, then the year. The box shows an example. Capital letters do not matter. You can write a month in full or with its first three letters.

Table 1. What uFTi reads

You type	It means
`15 March 1900` or `15 Mar 1900`	A whole date.
`March 1900`	A month and a year.
`1900`	A year.
`about 1900`, `estimated 1900` or `calculated 1900`	A date that is close, or that you worked out.
`before 1900` or `after 1900`	A limit.
`between 1850 and 1860`	The earliest and the latest date it could be.
`from 1850 to 1860`	Something that lasted for a while.
`44 BC`	A year before the common era. `BCE` works too.
`Julian 14 February 1750`	A date in the Julian calendar. Name the calendar first.
`12 February 1731/32`	A date with a dual year (Calendars and old dates (page 22)).
`1700 (Easter)`	The year `1700`, with the word Easter kept beside it.

What uFTi keeps as you typed it

These are not read as dates. uFTi keeps them exactly as you typed them. It does not use them to order your events.

- `15/03/1900` and `03/04/1900`. Countries put the day and the month in a different order, so uFTi does not guess.
- `1900-03-15` and `1850-1860`.
- `March 15, 1900`, with the month first.

- `c. 1850` and `circa 1850`. Write `about 1850` instead.
- `Easter 1700`. Write `1700 (Easter)` instead.

Check the line that says Reads as

When uFTi cannot read a date, it does not stop you, and it does not warn you. The line under the box only repeats what you typed, such as Reads as Easter 1700. So read that line each time. For a date that uFTi has understood, the line shows it in words, such as Reads as 15 March 1900.

A date that cannot be read stays in the box as text. **Edit as text** stays on for it, because the day, month and year pickers cannot show it.

Calendars and old dates

The four calendars uFTi keeps, and what you need to know when a record is from before 1752.

For a date in the last two hundred years or so, you can ignore this page. Every date is in the calendar that you use today, and uFTi assumes it. This page is for a researcher who meets an older date.

The four calendars

uFTi keeps a date in Gregorian, Julian, Hebrew or French Republican. Gregorian is the one you use today, and it is the default. You choose another under **Calendar** in the date editor. Or you type its name before the date, such as `Julian 14 February 1750`.

Then uFTi names the calendar in the date, as in 14 February 1750 (Julian). Some forms fix the calendar. A census form always uses Gregorian, and does not offer the list.

uFTi does not change a date from one calendar to another. It keeps the date as you entered it. Dates are ordered by the year in their own calendar.

The change of 1752

Britain and its colonies used the Julian calendar until September 1752. In that month, Wednesday 2 September was followed by Thursday 14 September. Many Catholic countries had changed in 1582, and other countries changed at other times. So the place matters as well as the year.

uFTi does not know about the change. It takes `3 September 1752` as an ordinary date, and does not warn you, though that day never happened in Britain. Check dates of this time yourself.

The two calendars differed by ten days in the 1600s and by eleven days in the 1700s. A record from the time gives the day as it was then. Naming the calendar tells the next reader which kind of date it is.

It was really two changes. The year 1751 began on 25 March and ended on 31 December. Then eleven days were left out in September 1752. A record made near these changes can look wrong, by days or a year, when it is right.

The year that began in March, in Britain

This part is about England, Wales and Ireland, and the British colonies. Before 1752, the year there began on 25 March, not on 1 January. A day in February was still in the old year. Writers marked this with a dual year, such as 1731/32. It means 1731 by the old rule and 1732 by ours.

Scotland began its year on 1 January from 1600. Other countries changed the start of the year at other times. A dual year belongs to a British record from 1 January to 24 March, up to 1751. Check the place of your record.

Type a dual year, such as `12 February 1731/32`. uFTi shows the date as you wrote it. The date pickers cannot hold a dual year, so it is always typed. uFTi orders it by the first year, 1731. A worked case: a birth in January (page 23) shows why this matters.

Hebrew and French Republican dates

Hebrew dates appear in Jewish records. France used the French Republican calendar from 1793 until the end of 1805. For these two calendars, uFTi checks only that the day is possible. It does not work out the other calendar for you.

A worked case: a birth in January

How a year that began in March can change a birth year, shown with a diarist born in 1671.

This case shows why the old year matters. Read Calendars and old dates (page 22) first.

The evidence

Abraham De la Pryme was a diarist in Yorkshire. In his diary, he says he was born on 15 January 1671. His own list of the family, at the front of the diary, says the same.

The same list says that his parents married on 3 April 1670. It also says that his brother Peter was born on 29 April 1672. The printed edition of 1870 is the source for all of this.

The question

In England at that time, the year began on 25 March. If Abraham used that rule, then January 1671 was January 1672 by our count. Then Peter would have been born about three months later. That cannot be right.

So Abraham probably began his year on 1 January. His parents' wedding fits too: a birth in January 1671 comes about nine months after April 1670. His birth year is then 1671 in either count.

Why it matters

In England, a writer who gave a date from January to March might use either year. Someone adding one to a January year, because of the old rule, would get 1672. The family's own dates suggest that this would be wrong here.

The same early months appear in two ways in the edition. The preface says that Abraham took his degree in January 1693. A footnote prints the year of another man's degree, at the same college, as 1692-3. The two forms name one year.

His own letters, as printed, show the other way. One is dated 2 February 1701-2, and another 25 January 1703-4. Each date comes before 25 March, so each year has two numbers. The same person can write a year differently in different records. Check each one.

What to record

- Type the day as the source gives it: `15 January 1671`.
- Add a dual year only if a source prints one, such as `12 February 1731/32`.
- Put each source and its page against the date. Then the next reader can weigh the evidence.
- If the day was in the Julian calendar, you can name it: `Julian 15 January 1671`. A worked case: two calendars in one life (page 24) shows what that changes.

A worked case: two calendars in one life

How far apart the Julian and Gregorian calendars were in the life of a diarist who lived from 1671 to 1704.

Abraham De la Pryme was a diarist in Yorkshire. England used the Julian calendar all through his life, so his dates are Julian. This case shows how far they were from the Gregorian calendar. Read Calendars and old dates (page 22) first.

Ten days, and then eleven

The Gregorian calendar was ten days ahead when Abraham was born. The gap grew while he lived. The year 1700 had a 29 February in the Julian calendar, but not in the Gregorian calendar. So, from March 1700, the gap was eleven days.

Table 1. Four of his dates in both calendars

What happened	Julian, as written then	Gregorian	The gap
His birth	15 January 1671	25 January 1671	10 days
A letter from Hull	20 November 1699	30 November 1699	10 days
Another letter from Hull	18 September 1700	29 September 1700	11 days
His death	12 June 1704	23 June 1704	11 days

uFTi does not work out the other calendar for you. We worked out this table by hand.

A day of the week can show the calendar

A friend wrote in his own diary that Abraham died on a Monday, the 12th of the month. The preface of the printed diary gives this, for June 1704. In the Julian calendar, 12 June 1704 was a Monday. In the Gregorian calendar, it was a Thursday. So the friend's date is a Julian one.

When a record names the day of the week, you can test its date in this way.

What his dates cannot show

Abraham died in 1704, so his dates stop before the change of 1752. Calendars and old dates (page 22) explains that change.

What to record

Keep the date as the record gives it. If you want to show which calendar it is, type its name first, such as `Julian 12 June 1704`.

Dates in lists and in order

Where you can enter a date, how uFTi shows it, how it puts dates in order and what it checks.

Where you can enter a date

- **Date of birth** and **Date of death**, in the **Basic details** form.
- The date of the event, in the Baptism, Birth, Burial and Death forms. The Event details form also has one.
- The date of a marriage or other event, and the date of birth of each child, when you add a family.
- The date of the census, in every census form. The 1939 register also asks for each person's date of birth.
- The date of an event in a marriage register form.

A source has no date of its own. Give the date of a record to the event it is about.

How uFTi shows a date

A date is written in words, in the language of the app. It does not follow the date settings of your device. You will see 15 March 1900, March 1900 and 1900. An uncertain date reads about 1900, before 1900, after 1900, between 1850 and 1860 or from 1850 to 1860. A year before the common era reads 44 BC. A life span in a list reads 1816–1855.

How uFTi puts dates in order

uFTi orders by the year of the first date, as if that date were exact. It does not use the month or the day for an uncertain date.

Table 1. How each kind of date is ordered

Date	It is ordered as
`about 1850`	The year 1850.
`before 1900` and `after 1900`	The year 1900, both. Neither goes before or after it.
`between 1850 and 1860`	The year 1850.
`from 1850 to 1860`	Its start, 1850.
A year before the common era	Before the year 1.
A date kept as typed	It is not ordered by year, because uFTi reads no year in it.

On the page of a person, the events are in order of year, and then by the kind of event. The month and the day are not used. Events with no date come last. The family tree view uses the year, then the month, then the day, of the first date.

What uFTi checks

While you enter a date, uFTi checks that the day exists in that month and year of the calendar. It does not check that the events of one person are in a sensible order. Check yourself that a baptism comes after a birth, and a burial after a death.

Some forms warn you about a date but never stop you. A census form expects a Gregorian date on the day of the census.

Years before the common era

uFTi has no limit on the earliest year. Type `BC` or `BCE` after the year, such as `44 BC`. The date pickers cannot enter these years, so you always type them.

Places

How uFTi records a place, and how it helps you spell a place the same way each time.

In uFTi, a place is the words you type. There is no map, and no list of places to pick from. So type the place as your record gives it, such as a town or a parish.

Where you are asked for a place

You meet a place box in these forms:

- **Place of birth** and **Place of death**, in the **Basic details** form.
- **Place of birth (new child)**, when you add a family.
- The place box in the details of an event.

They all work in the same way.

Typing a place

An empty box says Start typing a place.... As you type, uFTi shows the places in this tree that match. It shows up to eight, underneath the box. Choose one to use it. Or keep typing a new place.

Spell it the same way each time

The places offered are the ones you have already typed in this tree. When you choose one, the place is spelled exactly as before. That keeps one place from turning into two.

When a record spells a place in a different way, type it as the record does. Then the tree shows what the record said.

Names

What uFTi does when you save a person whose name is already in the tree, and how to choose.

A person has **Given name(s)** and **Surname**. Families use the same names again and again. So two people in your tree may share a name, and a name you type may belong to someone you have already added.

The question uFTi asks

When you save a form that would make a person with a name that is already in the tree, uFTi stops and asks you first. A box opens. Its title says that the name is already in this tree. If more than one person has the name, it says how many.

Your choices

Under the title, there is one button for each person who has that name.

Use, then the name and the years
: Choose this when it is the same person. The form goes with that person, and uFTi does not make another one. The years of birth and death help you tell people apart.

Add a new person called, then the name
: Choose this when it is a different person who has the same name. uFTi makes a second person.

If you are not sure, look at the other person first. Do not join two people unless your records say they are one.

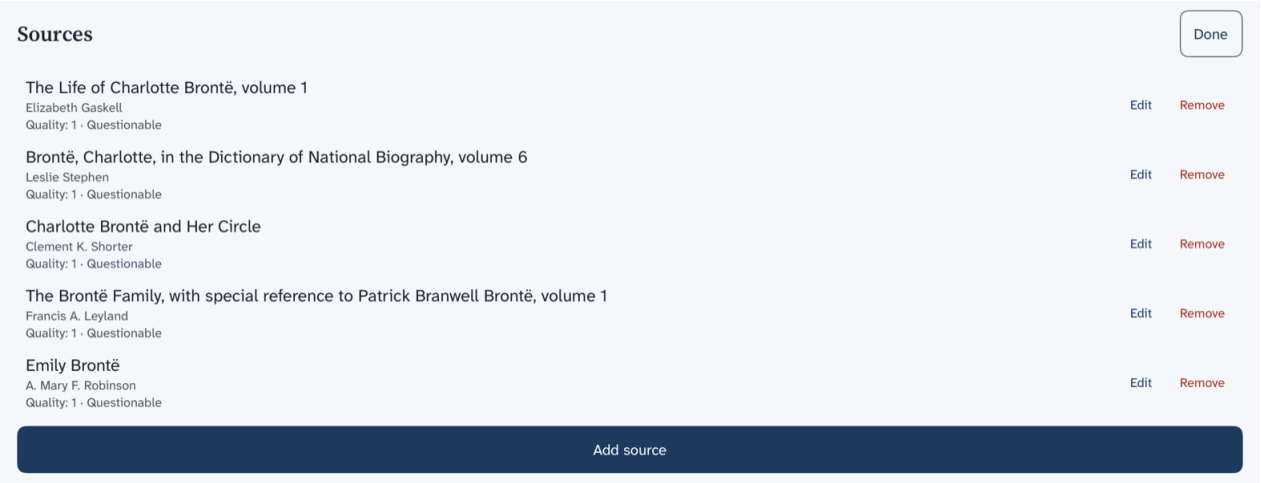

Look at the sources of a fact

See which books and records back up a birth, a death or another fact, and change or remove one.

Each fact on a person's page has a small chip that counts its sources. A chip that says Sources: 0 means nothing backs that fact up yet. Every count of sources uses the same words, so you see them on a person's card in search results and on the Notes screen too.

1. On the page of a person, choose the chip beside **Birth**.

   A screen named **Sources** opens. Each source shows its title. Under the title, a line gives the author and where the source is kept, when the source has them. A source that you make in the app has no author, so its line shows only where it is kept. A quality line shows when the citation records a quality.

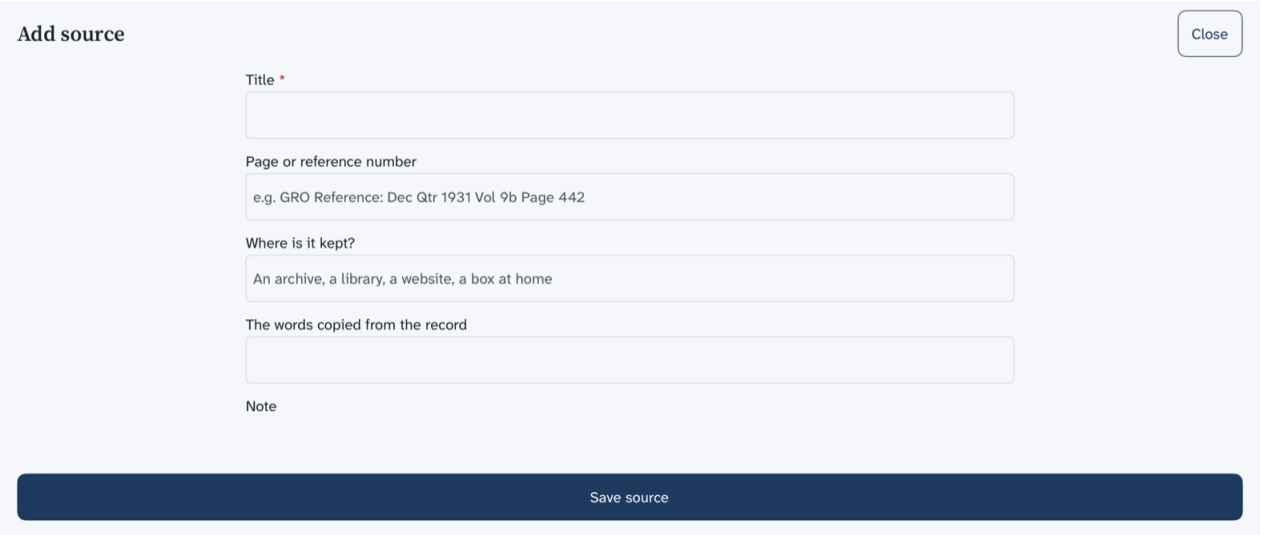

2. Choose **Edit** beside a source to change it.

   A form opens with the title and the other details. Choose **Save source** to keep your change.

3. Choose **Remove** beside a source to take it off this fact.
4. To add a source, choose **Add source**, then **Add a new source**.

   A form opens. It has boxes for the title, the page, where the source is kept, the words copied from it and a note. Only the title is needed.

5. Type the title, then choose **Save source**.
   One more step offers to attach a copy of the source. You can skip it.

6. Choose **Done**.
   The list now shows the new source.

7. Choose **Done** again when you have finished.

You are back on the page of the person. The chip shows the new count.

A fact with no source shows the words No sources for this fact yet. and the button **Add source**. When the fact has one place, such as a birth place or a death place, **Compare records that disagree** shows under it. It is for two records that give different answers. The button is not there once the fact has a source.

The screen that opens from **Add source** also has a box to search for a source you have already added. Use it when one book backs up many facts.

Next: Add another person (page 30).

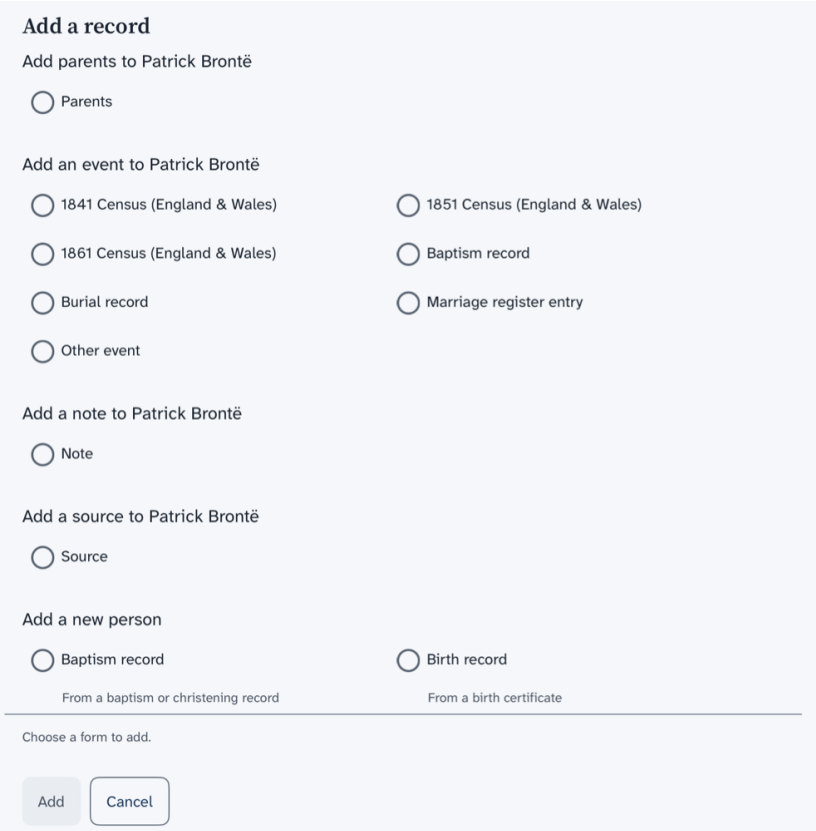

Add another person

Add a person to a tree that already has someone in it.

The first person comes with a new tree. After that, you add people with **+**.

1. Choose **+** at the top right.

   A sheet named **Add a record** fills the screen. If a person is open, it starts with things you can add to that person.

2. Scroll down to the part named **Add a new person**.
3. Choose **Basic details**, then choose **Add** at the bottom.

The button stays grey until you choose a form.

The **New person** form opens.

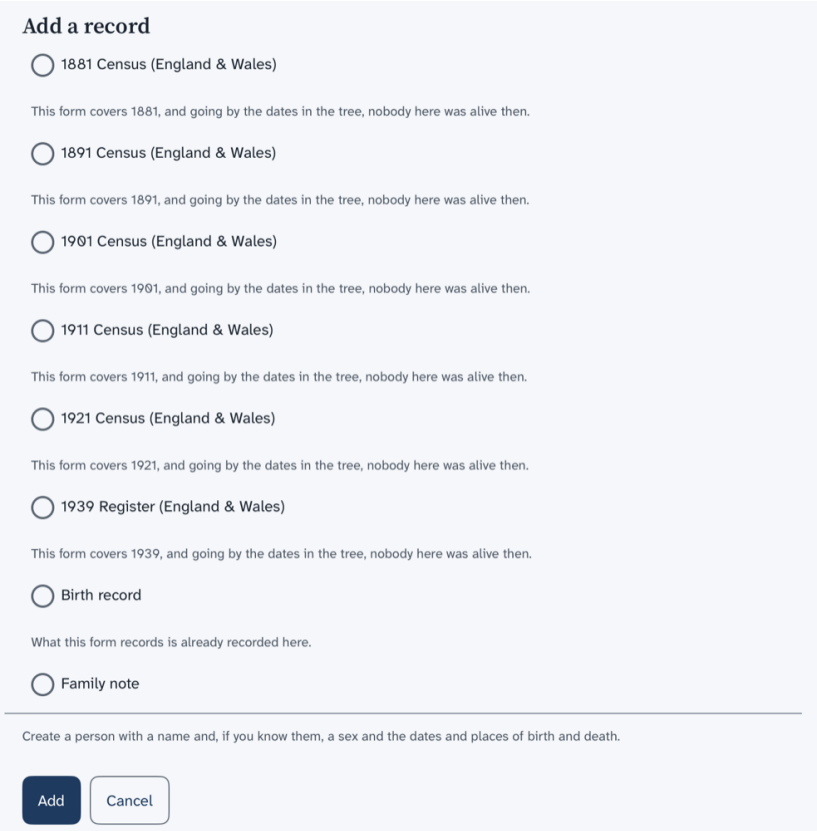

4. Type the names, choose the sex and add the dates and places you know.
   Only **Given name(s)** is needed. For a date, type the day and the year and choose the month from the list. A line under the date says how the app reads it, such as Reads as 17 March 1777.

5. Scroll to the bottom of the form and choose **Save**.
   You go back to the screen you came from. The new person is in your tree.

To open the new person, Find a person (page 14).

The sheet ends with **More forms**, with a count in brackets. Choose it to see the forms that do not fit this person. Each one has a line under it that says why. For example, This form covers 1871, and going by the dates in the tree, nobody here was alive then.

Next: Add a family with children (page 33).

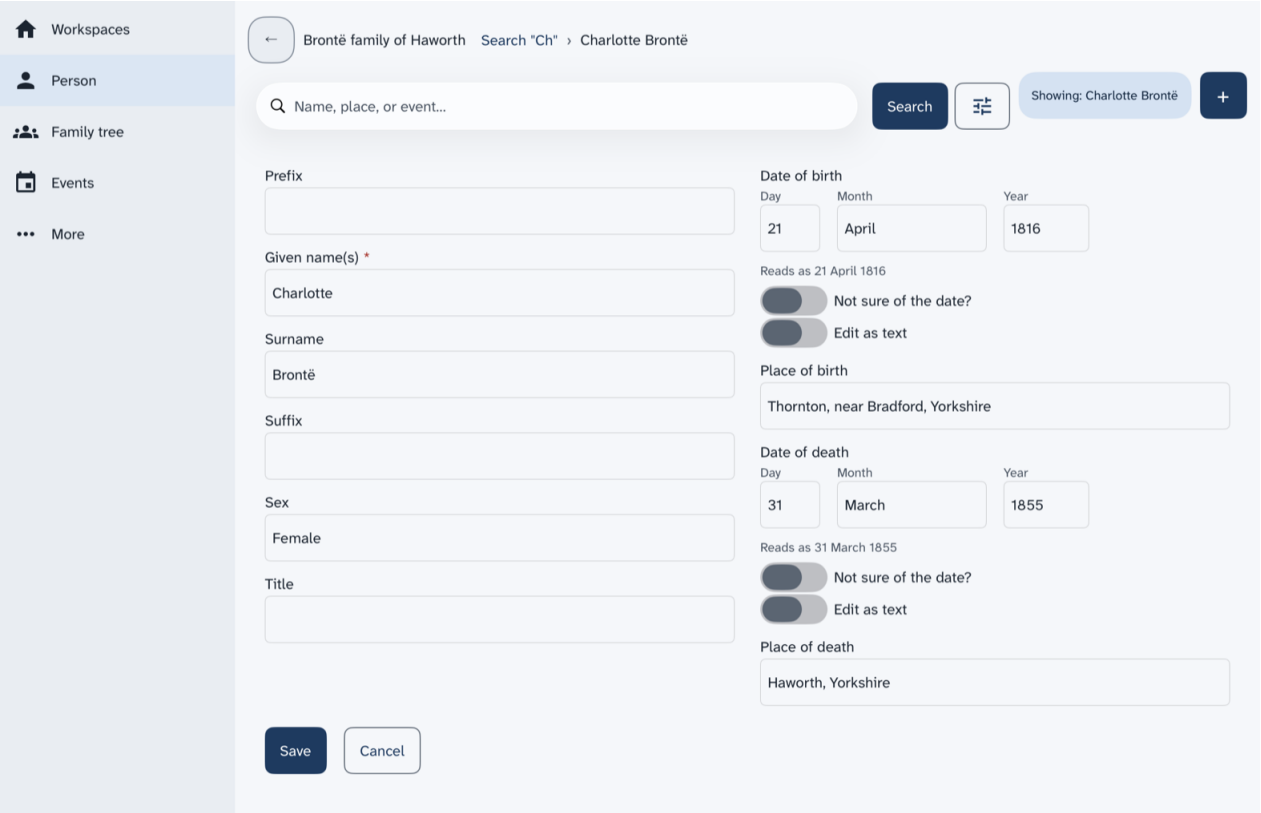

Change a person

Correct a name, a date or a place on a person's page.

Open the person first. Find a person (page 14) shows how.

1. Scroll to the bottom of the page and choose **Edit**.

   The page turns into a form. The names and the sex are on the left. The dates and places of birth and death are on the right.

2. Change what is wrong.
3. Under the form, choose **Save** to keep your changes, or **Cancel** to leave the form as it was.

Your changes are saved to the file as you go. The page shows the new words.

> The button **Delete person** sits below **Edit**. It removes the person. Check before you choose it.

Next: Look at the sources of a fact (page 28).

Add a family with children

Join two partners, record their marriage and add their children.

Add both partners first. Add another person (page 30) shows how.

1. Open one of the partners, scroll down and choose **Add a new family**. Then choose **Add**.
   A person who is not in a family yet shows this button under **Family**. The sheet that opens has the choice Family ticked for you.

   A form opens. The person you came from is already in one of the partner boxes.

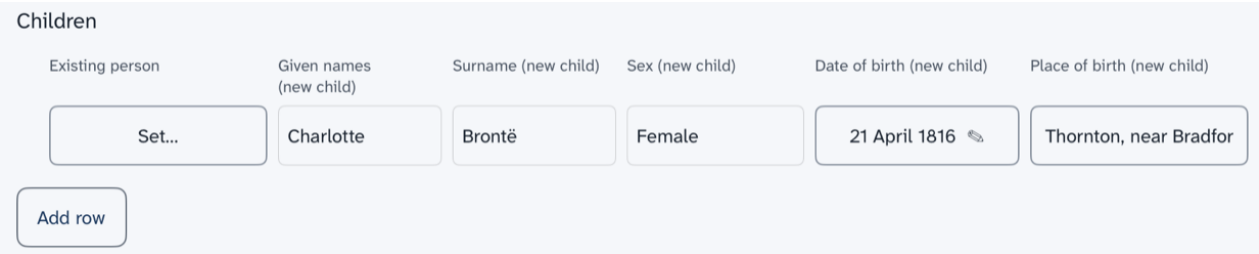

2. Select the other partner's box and type the name.
   A short list of people appears under the box.

3. Choose the person from the list.
   The name only counts once you choose it from the list.

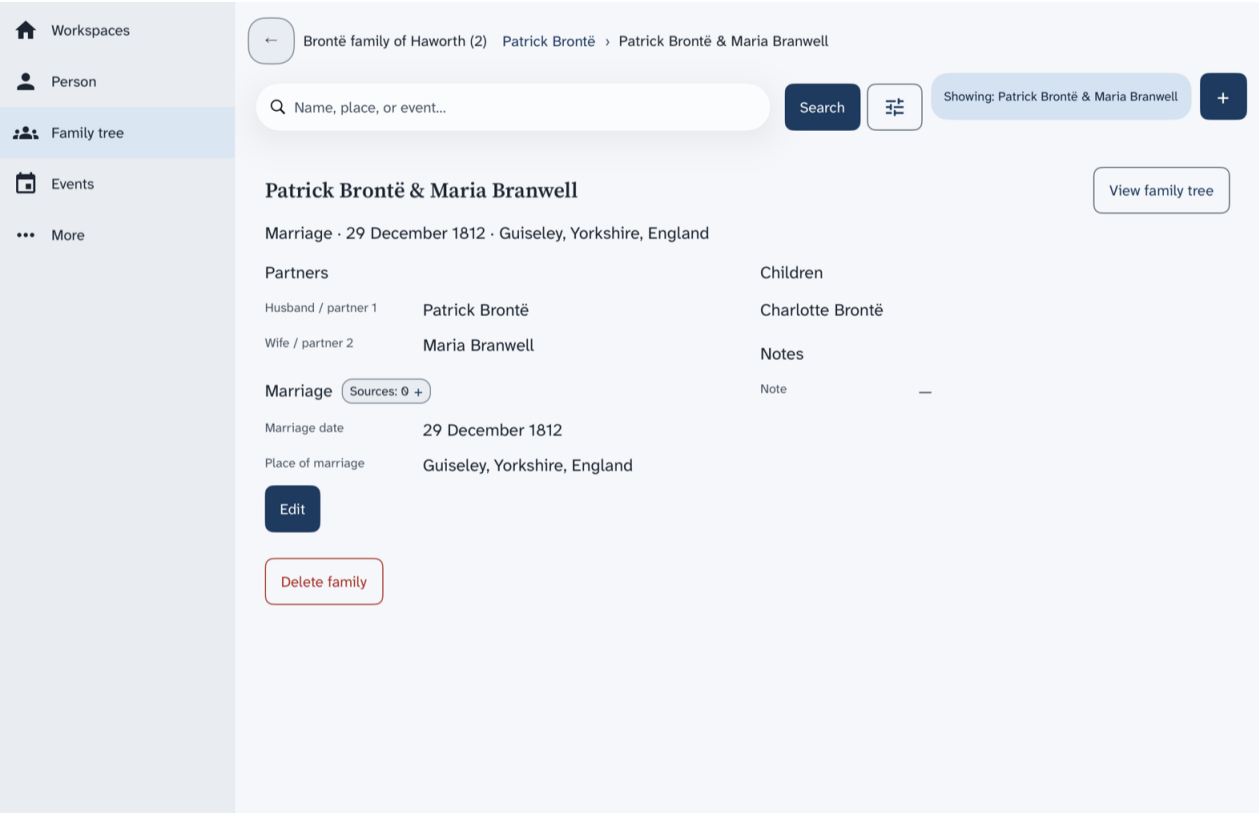

4. Scroll down and fill in **Marriage date** and **Place of marriage**.
   Leave them empty if you do not know them.

5. Under **Children**, choose **Add row**.
   A row appears for one child, with boxes for the names and the sex.

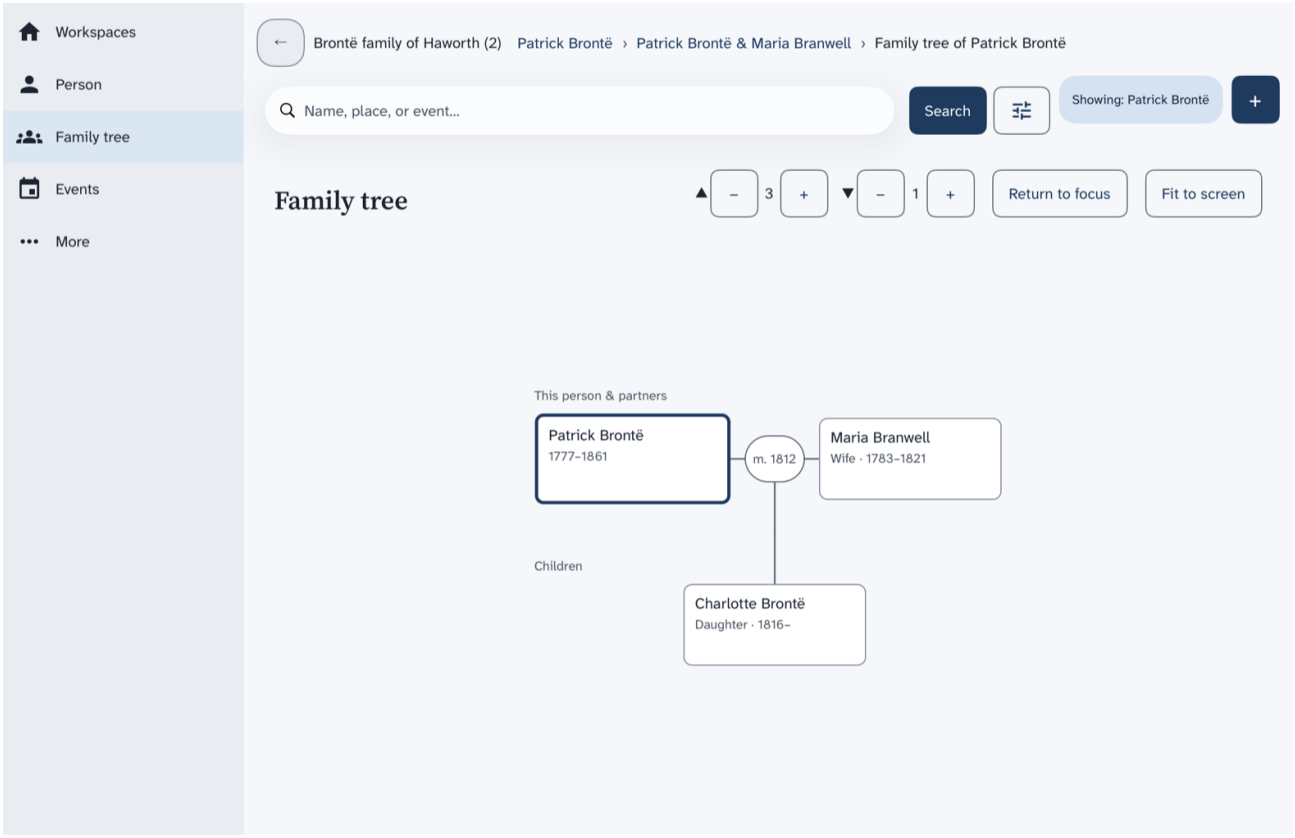

6. Type the child's names and choose the sex. Then choose **Set...** for the birth date and for the birthplace.
   A small window opens for each. Fill it in and choose **Done**. The button then shows what you typed, or the start of it.

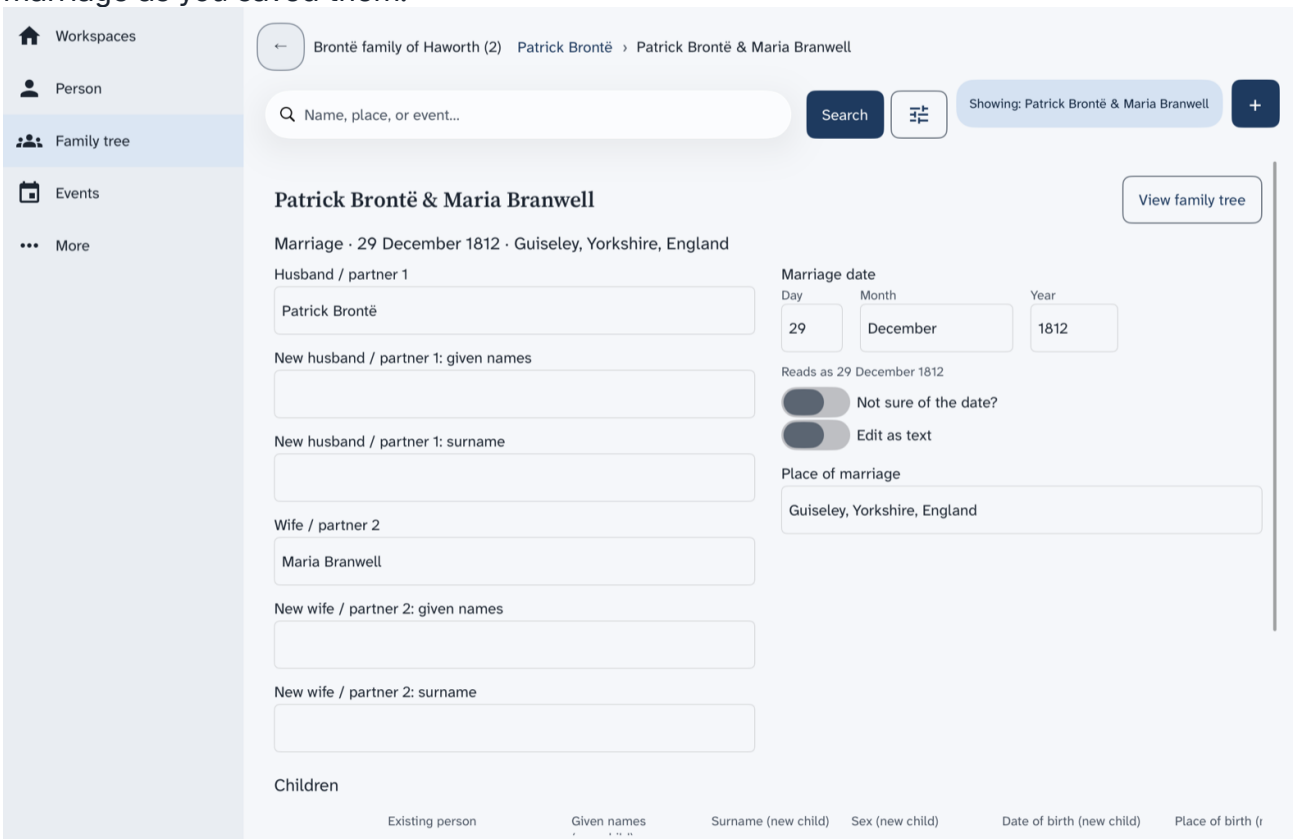

7. Scroll to the bottom and choose **Save**.
   The page of the family opens. It lists the partners, the marriage and the children.

Choose **View family tree** to see the family drawn out.

To change a family later, choose **Edit** on its page. The form shows the partners and the marriage as you saved them.

The page of the family also has **Delete family**. Next: Add a note to a person (page 36).

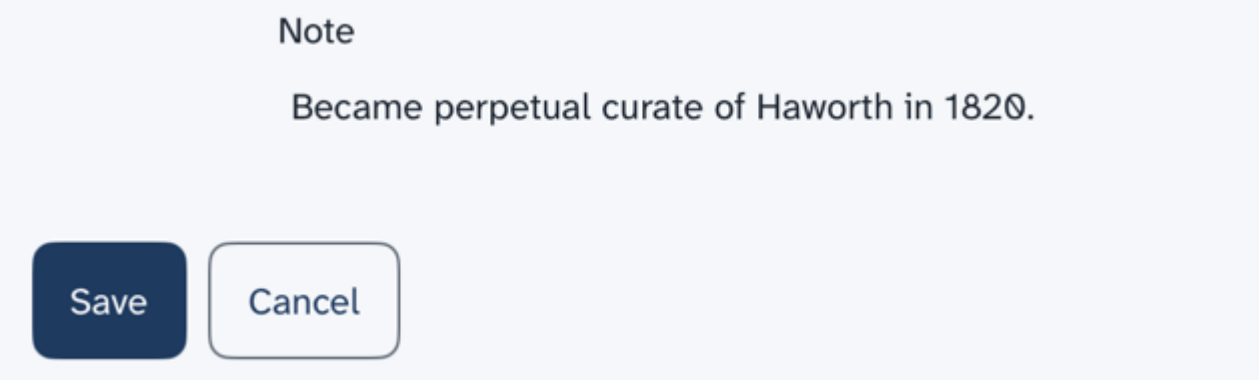

Add a note to a person

Write down something you know about a person that does not fit in a date or a place.

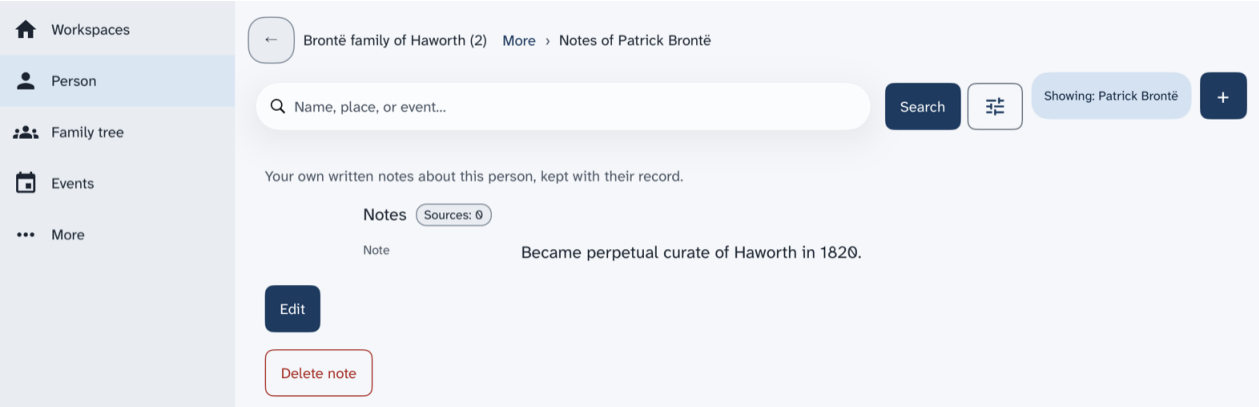

Open the person first. Find a person (page 14) shows how.

1. Choose **+** at the top right.
   The sheet named **Add a record** opens.
2. Choose **Note** under the part for a note, then choose **Add** at the bottom.
   Scroll the sheet to find the part.

   A form opens with one box for the note.

3. Type your note, then choose **Save**.
4. Choose **More** in the list on the left, then **Notes**.
   The note shows under **Notes**, with **Edit** and a button to delete it.

The note belongs to that person. Write what you know. Say where you read it if you can.

Next: Choose how the app looks (page 37).

The Photos buttons

What the buttons under Photos are for on a person, an event or a source.

A person's page, an event and a source each have a part named **Photos**. It has three round-cornered buttons in a row. Under them, the page says No attachments yet until you add a picture.

The same three buttons appear when you attach a copy of a source. Which file to send (page 44) says which file to send to family, and whether the pictures go with it.

The camera button

The first button has a camera on it. It is for a new photo, such as a photo of a certificate.

The first time, the iPad asks if uFTi may use the camera. Choose **Allow** to take photos in the app. If you do not allow it, a box says that the camera is needed to photograph a document.

The folder button

The second button has a folder on it. It is for a picture or a scan that is already on your iPad. Your iPad opens its own Files screen. Choose a picture, or choose the cross at the top to leave it.

The chain button

The third button has a chain link on it. It is for a picture that is already in this tree, so you can use it again on a second person. A list named Link existing media opens, with a box to search the pictures by what they show. A new tree has none yet. Choose **Close** to leave it.

The fourth button

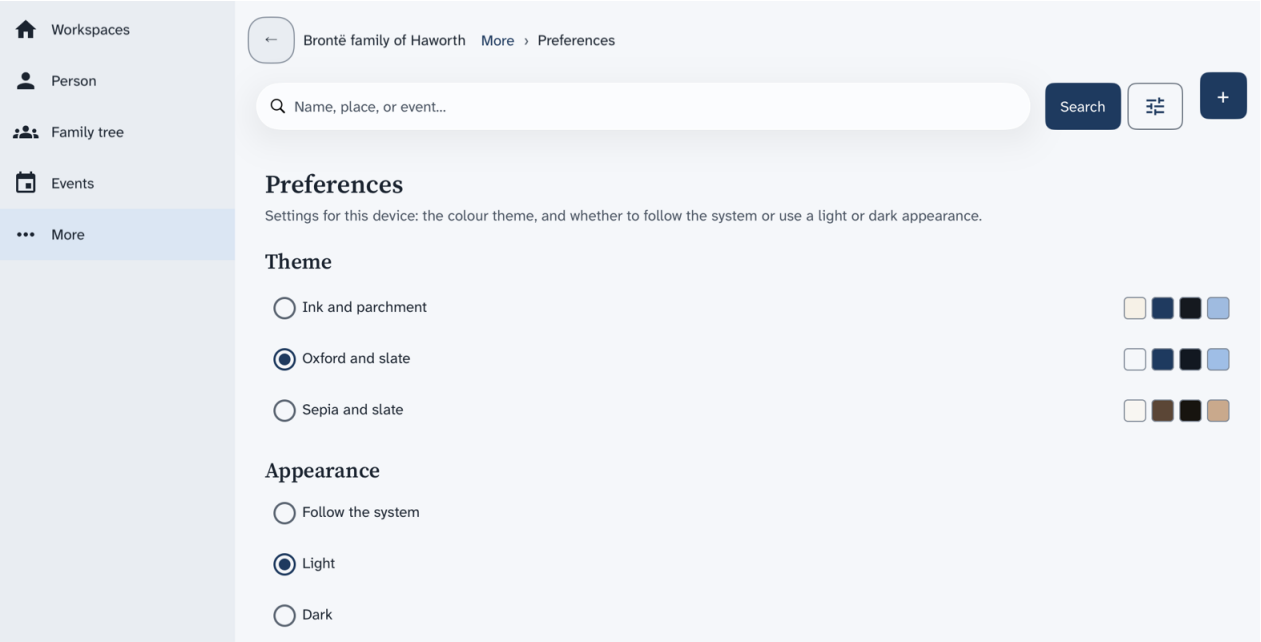

When a page already has pictures, a fourth button shows, with an arrow that points down. It copies all the pictures of that page to a folder. Your iPad opens its own screen for choosing a folder.

Choose how the app looks

Pick a colour theme, and a light or dark look, for this iPad.

These settings are for this iPad only. They do not change your family tree files.

1. Choose **More** in the list on the left, then **Preferences**.
   The screen shows two groups of choices.

2. Under **Theme**, choose a set of colours.

   The first group has three themes, and a row of four colour squares shows each one. **Oxford and slate** is the one in the pictures in this manual.

3. Under **Appearance**, choose **Follow the system**, **Light** or **Dark**.

   The first choice copies the setting you made on your iPad.

The change shows at once. The app keeps your choice the next time you open it.

A page says no person is selected

What to do when Family tree asks you to pick a person first, or Person, Events and Notes show only the search box.

You choose **Family tree** and the page says Select a person to view their family tree. Or you choose **Person**, **Events** or **Notes** and the page is empty under the search box.

Cause

These pages show one person at a time. You have not opened anyone since the app started. There is no chip that starts with **Showing** at the top.

Remedy

1. Type a name in the search box at the top, then choose **Search**.
2. Choose the card of the person you want.

   The chip that starts with **Showing** shows their name. The page now works.

Cause

The page is empty because nothing has been added to the tree yet. **Where records are kept**, **Who made this tree** and **Research questions and notes** start empty.

Remedy

Choose **+** and add the first one.

Bring in, share and keep safe

What your workspace holds, why a GEDZIP file is the one to keep and send, and when a plain family tree file is better.

Your tree is more than one file. It is the family tree, its research notes, and the pictures and other files you attach. This chapter says what uFTi does with a file you open, how to keep a copy safe, and which file to send.

The short answer is the GEDZIP file. It holds your whole workspace in one file. Keep your work in a GEDZIP file, and send a GEDZIP file to anyone who also uses uFTi.

A plain family tree file is for older programs only. It leaves out your pictures and other attached files.

Your tree may have started in another program. Your family may want a copy. This chapter is for both.

Your workspace and its files

A workspace is your family tree and its linked files, and a GEDZIP file holds all of them in one file.

A workspace is one family tree and everything kept with it. That is the family tree file, with its research notes, and the pictures and other files you attach to people, facts and sources.

Linked files

The family tree file does not hold your pictures. It links to them, and the pictures stay in files of their own. The same is true of other attached files.

So if you send only the family tree file, the other person gets the tree and its links, but not the pictures.

One file for the whole workspace

A GEDZIP file puts the family tree file and all the files linked to it into one file. You send one file, and nothing is left behind. Another person who uses uFTi opens it and sees your whole workspace.

For that reason, a GEDZIP file is the one to keep and the one to share between copies of uFTi.

The plain family tree file

A plain family tree file holds the people, families, facts, sources and research notes. It does not hold the pictures or other attached files.

When you save one, uFTi asks which version of GEDCOM to use. Choose GEDCOM 7, which was published in 2021 and is the one it recommends. Choose GEDCOM 5.5.1, which was published in 1999, only for an older program that cannot read GEDCOM 7.

A GEDZIP file holds a GEDCOM 7 family tree file, with the pictures and other attached files beside it.

At a glance

Table 1. Which file holds what

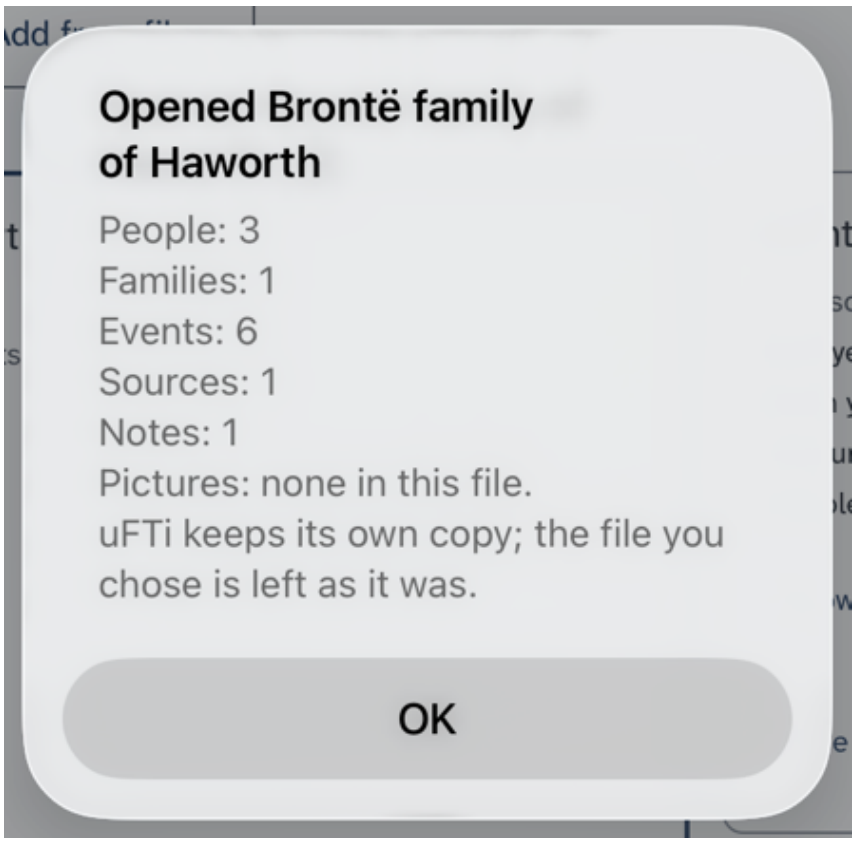

File	The tree and its research notes	Pictures and other attached files	Use it to
GEDZIP file	Yes	Yes	Keep your work, and share it with another copy of uFTi.
Plain family tree file	Yes	No	Share with another program that reads GEDCOM, or work with one.

Open a family tree file

Bring a tree from another program, or a copy from a relative, into uFTi.

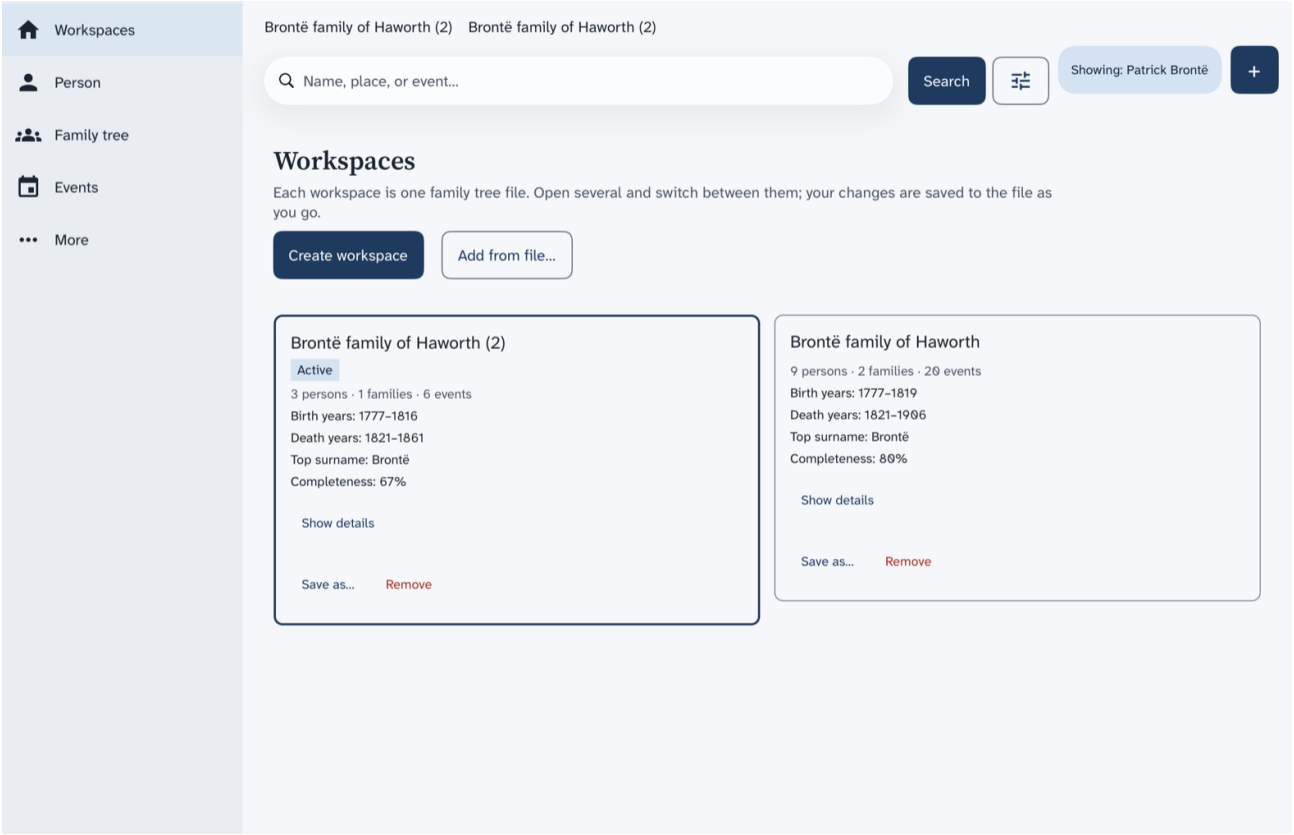

A family tree file ends in .ged or .gdz. Put the file on your iPad first, for example in the Files app, under On My iPad. uFTi works on its own copy, so the file you choose stays as it was. Opened files and copies (page 43) says more.

1. On **Workspaces**, choose **Add from file...**.
   The iPad's own Files screen opens.
2. Find the file, for example under On My iPad, and choose it.
   A box names the tree and counts the people, families, events, sources and notes in it. It says uFTi keeps its own copy; the file you chose is left as it was.

3. Choose **OK**.
   The tree has a new card on **Workspaces**.

The cards sit two to a row. Choose a card to make that tree the open one. Choose **Show details** on a card to see which file it is.

> A card takes its name from the file. If two cards have the same name, choose **Show details** on each to tell them apart.

> Sometimes the box and the new card do not show at once. Before you choose the file again, look at the list: the tree may already be there.

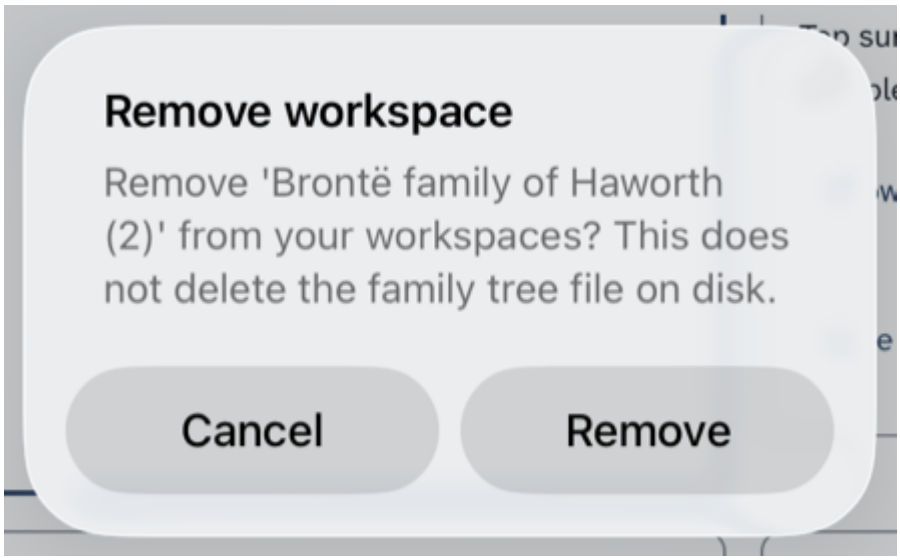

Next: Keep it safe (page 7).

Remove a tree from the list

Take a tree off the Workspaces screen without deleting its file.

1. On **Workspaces**, find the card of the tree.
2. Choose **Remove** on that card.

   A box named Remove workspace asks you to check. It says the family tree file is not deleted.

3. Choose **Remove** in the box, or **Cancel** to stop.

The card is gone, and a line at the bottom says the tree was removed. The file is still on your iPad. Open it again with **Add from file…** at any time.

Opened files and copies

On a phone or tablet, uFTi works on its own copy of the file you choose, so the file you chose stays as it was.

When you choose a family tree file, uFTi gets a copy of it and keeps the copy as its own. When the file opens, uFTi says so in one line. It works on that copy, so the file you chose does not change.

The file you chose

The file you chose stays as it was, however much you add. That also means it does not show your new work.

Get your tree out

The copy that uFTi works on is not a file you can pick up and send. To get your tree out, choose **Save as...** on the card for your tree. Then choose how to save it, and where to put the file. Choose the GEDZIP file, unless you need a plain family tree file for an older program.

The file you save is a saved copy. It stays as it was when you made it. Make a new one after you add a lot.

Sending your tree

Send a GEDZIP copy that you saved. Which file to send (page 44) says why.

Which file to send

Send a GEDZIP file to anyone who uses uFTi, and a plain family tree file only to an older program.

To share your tree with someone who uses uFTi, save a copy as a GEDZIP file with **Save as...** , and send that file. Keep it safe (page 7) shows how to make one.

A GEDZIP file holds your whole workspace: the tree, its research notes, and the pictures and other attached files. It is one file, so you can send it from your phone or tablet. Nothing is left behind, so the other person sees what you see. Your workspace and its files (page 40) says more.

For an older program

Some older programs cannot read a GEDZIP file. For them, save a plain family tree file instead. It holds the people, families, facts, sources and research notes, but not the pictures or other attached files. If the other person needs the pictures, send them as well.

Do not send the file you chose

Do not send the file you chose when you opened your tree. uFTi did not change it, so it does not show your new work. The copy that uFTi works on is not a file you can send.

A saved copy stays as it was when you made it. Make a new one before you send, if you have added anything since.

Glossary

B D F G J P S W

B

backup

An older copy of your family tree file, which the app makes for you. It is made the first time the app saves after you start it.

D

dual year

A year written with two numbers, such as 1731/32. In Britain, it marks a date from 1 January to 24 March, up to 1751.

F

fact

Something you record about a person, such as a birth with its date and place.

family tree file

A GEDCOM file that holds a whole family tree, with its people, families, facts, sources and research notes. It does not hold pictures or other attached files. You can open one, save one and send one.

G

GEDCOM

The standard format for family tree files. Many family tree programs read it. GEDCOM 5.5.1 was published in 1999. It has been the common format for more than twenty years. GEDCOM 7, published in 2021, is the newer version. A version belongs to the standard, not to uFTi.

GEDZIP

One file that holds a whole workspace. It has the family tree with its research notes, and the pictures and other files. It is the best way to save and send your work.

Gregorian calendar

The calendar that you use today. Britain changed to it in September 1752.

J

Julian calendar

An old way to count the days. Britain used it until 1752.

P

pedigree

A family tree drawn for one person. It shows their parents above them, and their partners and children.

S

saved copy

A copy of your tree that you save yourself, as a GEDZIP file (preferred) or a family tree file. It stays as it was when you made it.

source

Where you found a fact. It can be a certificate, a census page, a book, or what someone told you.

W

workspace

One family tree and everything kept with it. That is the family tree file with its research notes, and the pictures and other files you attach. A GEDZIP file holds all of it. You can have more than one.
